SDG 15: LIFE ON LAND PROGRESS REPORT

Sustainable Development Goal 15 (SDG 15), *Life on Land*, aims to protect, restore, and sustainably use terrestrial ecosystems, promote sustainable forest management, combat land degradation, and halt biodiversity loss. For higher education institutions, this goal can be advanced through environmental education, responsible resource management, habitat restoration, community clean-up activities, student service-learning, and partnerships that encourage communities to protect their natural surroundings. The City College of Cagayan de Oro (CCCDO) contributes to these objectives by connecting education and community participation with practical environmental initiatives.

This report examines CCCDO's conducted SDG 15-related activities in 2024 and 2025, highlighting the development of its environmental initiatives and their contributions to sustainability. In 2024, the College conducted activities that included exploratory work toward establishing a Bamboo Hub in Barangay Mambuaya, participation in the city's "Klarex nga Kalimpyo sa Kadalanan ug Tugkaran" clean-up campaign, and mangrove planting. These initiatives demonstrate the College's early efforts to promote sustainable resource use, maintain clean surroundings, and protect natural habitats through environmental action and community participation.

In 2025, the College's documented activities covered a broader range of tree-growing, mangrove rehabilitation, coastal clean-up, and community service-learning initiatives. These activities involved students, employees, volunteers, local government offices, and partner organizations, demonstrating how environmental stewardship can be strengthened through collective action and community engagement.

The comparison examines how CCCDO's documented approach developed between the two years, why the initiatives matter for terrestrial ecosystems and biodiversity, and what the reported outputs reveal about implementation. It also distinguishes immediate outputs from longer-term environmental outcomes. For example, planting seedlings is a direct restoration activity, while their survival, growth, and contribution to improved habitat conditions are longer-term outcomes that require monitoring and evaluation.

Executive Assessment

The available materials show continuity in CCCDO's environmental stewardship between 2024 and 2025, accompanied by a broader and more clearly documented range of restoration and community-engagement activities in 2025. In 2024, the College connected sustainable land and resource management with livelihood-oriented bamboo industry development and participation in local clean-up efforts. The documented mangrove planting activity also indicates that habitat restoration was part of its environmental engagement before the 2025 initiatives.

In 2025, CCCDO's environmental initiatives became more visible through several named projects and activities conducted throughout the year. Baybayani 2025 collected 30 sacks of garbage across three coastal areas, while Baybayani 2.0 involved 60 volunteers in planting 300 mangrove seedlings. Baybayani 3.0 brought together college volunteers and partner organizations for an Earth Day coastal clean-up. In addition, NSTP students conducted community immersion in Barangay Agusan, and two December activities focused on tree-growing and tree planting in Macasandig.

These activities indicate a broader application of environmental stewardship, moving from a combination of sustainable resource-use planning and community cleanliness toward repeated, hands-on restoration and community service. They also demonstrate opportunities to integrate environmental responsibility into student learning, volunteerism, and partnerships with local stakeholders.

The initiatives matter because ecosystems and biodiversity are affected by land-use practices, waste disposal, habitat disturbance, and the condition of vegetation in terrestrial and coastal environments. Bamboo resource planning connects environmental sustainability with the responsible use of natural materials and potential livelihood development. Clean-up activities encourage proper waste management and reduce litter in public and coastal spaces. Tree-growing and mangrove rehabilitation support vegetation restoration and can contribute to habitat improvement when the appropriate species are planted in suitable locations and successfully established. Student participation further strengthens environmental awareness, civic responsibility, and cooperation between the College and its partner communities.

Overall, the reported activities demonstrate CCCDO's continuing contribution to SDG 15 through environmental action, restoration initiatives, and community engagement. However, the reported outputs primarily measure participation and immediate accomplishments. Assessing longer-term progress will require additional evidence, including seedling survival rates, tree growth, restored habitat areas, waste reduction, and measurable improvements in ecosystem conditions and biodiversity.

Key Findings

- The 2024 baseline combined sustainable resource development through the proposed Bamboo Hub and accredited bamboo-related training commitments with participation in community clean-up efforts.
- The supplied historical record also identifies a 2024 mangrove planting activity, providing continuity between the earlier conservation work and the restoration activities described in 2025.

- The 2025 account contains more detailed descriptions of tree-growing, mangrove rehabilitation, coastal clean-ups, and student service-learning across multiple dates and locations.
- The most specific quantified outputs in the 2025 sources are 30 sacks of garbage collected across three coastal areas, nearly 50 faculty and staff members participating with residents in Baybayani 2025, and 300 mangrove seedlings planted by 60 volunteers during Baybayani 2.0.
- The overall progression is best characterized as a broadening of the documented activity portfolio—from sustainable resource-use planning and local clean-up participation toward more explicitly described restoration, volunteerism, and community-based environmental service.

Institutional Context and SDG 15

SDG 15 recognizes that the condition of land-based ecosystems affects biodiversity, livelihoods, soil stability, water retention, and the resilience of communities. In CCCDO's local context, the reported initiatives connect these themes to resource use, street and community cleanliness, mangrove ecosystems, vegetation development, and student engagement. The College's role is not limited to physical activities: educational commitments, technical training pathways, community outreach, and partnerships can influence how people understand and manage natural resources.

The report considers three connected contribution areas. Sustainable resource use is represented by the 2024 Bamboo Hub initiative, which linked bamboo as a renewable resource with potential livelihood development and TESDA-accredited qualifications. Environmental stewardship is represented by clean-up campaigns and community participation. Ecosystem restoration is reflected in the 2024 mangrove planting record and the 2025 mangrove and tree-growing activities. These strands support different aspects of SDG 15 and are therefore discussed separately rather than being combined into a single impact score.

2024 Baseline: Sustainable Resource Use and Community Stewardship

Bamboo Hub and sustainable resource development

On April 3, 2024, CCCDO participated in an exploratory meeting concerning the establishment of a Bamboo Hub in Barangay Mambuaya. The discussion involved government agencies and farmer associations and focused on industry trends, innovations, and practices that could support a sustainable bamboo industry and generate income, particularly for local farmers. CCCDO's stated commitment was to open TESDA-accredited qualifications in Bamboo Engineering NC II and Bamboo Processing NC II.

This initiative provides a resource-management and livelihood dimension to the 2024 baseline. Bamboo is described in the source report as a highly renewable natural resource. Linking technical education to bamboo engineering and processing could help build the skills needed for responsible use and value-adding activities within a regional industry. The significance for SDG 15 is therefore indirect but important: land-based sustainability is connected not only to protecting habitats but also to how communities use natural resources and develop skills for livelihoods. The 2024 document records the exploratory meeting and training commitment, rather than completed training outputs or a quantified change in land condition.

Klarex nga Kalimpyo sa Kadalanan ug Tugkaran

The 2024 report also documents CCCDO's support for the city government's "Klarex nga Kalimpyo sa Kadalanan ug Tugkaran" campaign, including staff participation in a clean-up in Barangay Consolacion, Cagayan de Oro City. The activity sought to improve cleanliness in streets and surrounding areas while promoting discipline, civic responsibility, and environmental stewardship. Participation by the College's Technical Skills and Technology Department staff connected institutional service with a city-wide environmental effort.

This activity is relevant to SDG 15 because litter and unmanaged waste can contribute to local environmental degradation and affect the condition of public spaces and nearby land ecosystems. The campaign's importance also lies in its civic dimension: when employees and students participate in environmental service, the institution models practical responsibility for shared surroundings. In the supplied 2024 record, the achievement is described through participation and program purpose; a measured quantity of waste collected is not reported.

Mangrove planting as an early restoration strand

The supplied 2025 narrative identifies a Mangrove Planting Activity conducted in 2024 at the Mangrove Reserve in Bonbon, Cagayan de Oro City, with selected college personnel, faculty, and non-teaching staff. This earlier activity indicates that habitat restoration was part of CCCDO's environmental engagement before the 2025 Baybayani mangrove rehabilitation initiative. Mangroves occupy a land-sea interface, support biodiversity and wildlife habitat, stabilize shorelines, and perform important ecosystem functions.

For the comparative analysis, this 2024 activity establishes continuity in the College's engagement with vegetation and coastal habitat restoration. Its reported scope is not accompanied by a seedling count or an area-restored figure in the materials reviewed. It is therefore described as an identified restoration activity rather than assigned an estimated planting quantity.

How the 2024 baseline connects to SDG 15

Taken together, the 2024 activities show an approach with two complementary elements: sustainable use of a natural resource through the Bamboo Hub and local environmental stewardship through clean-up participation, alongside a reported mangrove planting activity. The combination is important because sustainable land management involves both reducing pressures on the environment and strengthening the skills, awareness, and community participation needed to care for natural resources.

2025 Progress: Restoration, Volunteerism, and Environmental Service

Baybayani 2025: Klarex nga Kalimpyo

On February 28, 2025, CCCDO conducted Baybayani 2025 in Barangays Agusan and Consolacion. The report states that nearly 50 faculty and staff members participated alongside local residents, visiting three coastal areas and collecting 30 sacks of garbage. This is one of the clearest measurable outputs in the 2025 record because the activity report includes both the number of areas covered and the quantity of garbage collected in sacks.

Although the activity is primarily a coastal clean-up and is directly related to SDG 14, it also complements SDG 15 by reducing litter pressure on interconnected land and coastal ecosystems and by promoting environmental stewardship. The 30-sack figure documents waste removed during the activity; it should not be interpreted as the total waste generated in the

areas or as proof that long-term pollution has declined. Compared with the 2024 local clean-up description, the 2025 article provides more specific activity-level output information.

Baybayani 2.0: Mangrove rehabilitation

On March 15, 2025, CCCDO took part in Baybayani 2.0 at Barangay Pangayawan, Gitagum, Misamis Oriental, in collaboration with CLIMBS Life and General Insurance Cooperative and Kusgan Volunteers Inc. The initiative involved 60 volunteers from CCCDO and CLIMBS, who planted 300 mangrove seedlings. This is a more quantified restoration activity than the 2024 mangrove planting record described in the supplied materials.

The 300 seedlings and 60 volunteers are direct outputs that show both implementation and participation. Mangroves provide habitat and nursery areas for wildlife, support biodiversity, help stabilize shorelines, and store carbon. Their contribution to SDG 15 is connected to habitat protection and ecosystem restoration; their coastal location also links this work to other environmental goals. The reported planting count should not be confused with the number of seedlings that later survive, but it establishes the scale of the planting activity as documented.

Baybayani 3.0: Earth Day coastal clean-up

On April 22, 2025, CCCDO participated in Baybayani 3.0 in the Agusan coastal areas in celebration of Earth Day. Faculty, staff, and NSTP student volunteers worked with partners and agencies including CLIMBS Cares, Plastik Republic, DENR Region X, CLENRO, Kusgan Volunteers Inc., and the Agusan Barangay Council. The account emphasizes coastal cleaning, environmental awareness, and collaboration rather than reporting a waste quantity comparable with Baybayani 2025.

The value of Baybayani 3.0 in the comparison is the continuity and breadth of participation. It shows that environmental service remained visible after the February clean-up and was linked to an internationally recognized environmental occasion. The multi-organization participation also illustrates that environmental management is a shared effort involving education, local government, civil-society organizations, and residents. For SDG 15, the relevance is complementary: reducing litter and strengthening stewardship can help protect the broader ecosystems connected to land and coastal habitats.

NSTP community immersion in Barangay Agusan

On May 15, 2025, NSTP students conducted a week-long community immersion and service-learning activity in Barangay Agusan. The program included community clean-up drives, basic literacy sessions, health awareness campaigns, and assistance with barangay operations. The activity was not explicitly tagged as an SDG 15 initiative in the supplied article, but its clean-up component and environmental service dimension align with CCCDO's wider stewardship activities.

The immersion adds an educational dimension to the 2025 portfolio. Students were able to apply classroom learning in a community setting while developing volunteerism and social responsibility. This matters for SDG 15 because environmental protection requires community participation as well as technical action. Service-learning can make sustainability tangible by connecting everyday surroundings with students' responsibilities as members of a wider community.

Baybayani 4.0: Tree-growing and volunteerism

On December 6, 2025, CCCDO's Extension and Outreach Office and City College Volunteerism and Involvement Center (CIVIC), in partnership with Andam Higala Inc., organized Baybayani 4.0 in Barangay Macasandig. Youth volunteers joined tree-growing and clean-up activities, while CLENRO provided environmental orientation. The event linked environmental action with volunteerism and the NSTP emphasis on annual tree planting.

Compared with the 2024 baseline, this initiative makes tree-growing a more explicit and practical part of the documented SDG 15 portfolio. Trees and other vegetation can support habitat availability, help hold soil in place, and contribute to local environmental quality when appropriate species are planted and maintained. The source describes the event's activities and partners but does not state a number of trees planted; therefore, its contribution is represented through the documented activity and participation framework rather than an estimated output count.

NSTP Tree Planting Activity 2025

On December 19, 2025, the NSTP Department conducted a tree-planting activity at Macasandig Rio Boulevard in cooperation with CLENRO. Student volunteers participated in hands-on environmental service, and the College explicitly identified the activity as contributing to SDG 15. Together with Baybayani 4.0 earlier in the month, the activity places tree planting and tree-growing visibly within CCCDO's late-2025 service and volunteerism calendar.

The two December activities are important because vegetation development supports the core concerns of SDG 15: ecosystem restoration, habitat creation, and responsible care for land. They also connect environmental protection with student formation. The immediate activity is tree planting; the broader ecological benefits depend on the appropriateness of the planting site, species selection, continued maintenance, and survival over time. The supplied report does not state an aggregate tree count for these two activities, so they are described qualitatively in the comparative analysis.

How CCCDO's approach developed from 2024 to 2025

The most evident change between the two reporting years is a broadening of the documented portfolio from sustainable resource-use planning and community cleanliness toward a sequence of practical restoration, volunteer, and service-learning activities. In 2024, the Bamboo Hub meeting linked natural-resource use with vocational qualifications and potential farmer livelihoods. The "Klarex nga Kalimpyo" campaign illustrated the College's participation in local cleanliness efforts, while the 2024 mangrove planting activity established an early restoration strand.

In 2025, those strands were more explicitly represented through named events and a calendar of activities. Baybayani 2025 and Baybayani 3.0 documented repeated coastal clean-ups; Baybayani 2.0 provided a specific mangrove planting count and volunteer figure; community immersion brought environmental service into NSTP activity; and two December events emphasized tree-growing and tree planting. The 2025 reporting therefore provides a more detailed picture of environmental activity across different places, dates, and partners.

This progression matters because land ecosystems face multiple, connected pressures. Sustainable resource use addresses how natural materials are managed. Clean-up activities address visible waste and encourage public responsibility. Mangrove and tree-growing initiatives focus on vegetation and habitat restoration. Service-learning and volunteerism involve

students and residents in the practical work of environmental stewardship. These approaches reinforce one another, although they generate different kinds of outputs and should not be treated as interchangeable measures of ecological impact.

Figures and Comparative Analysis

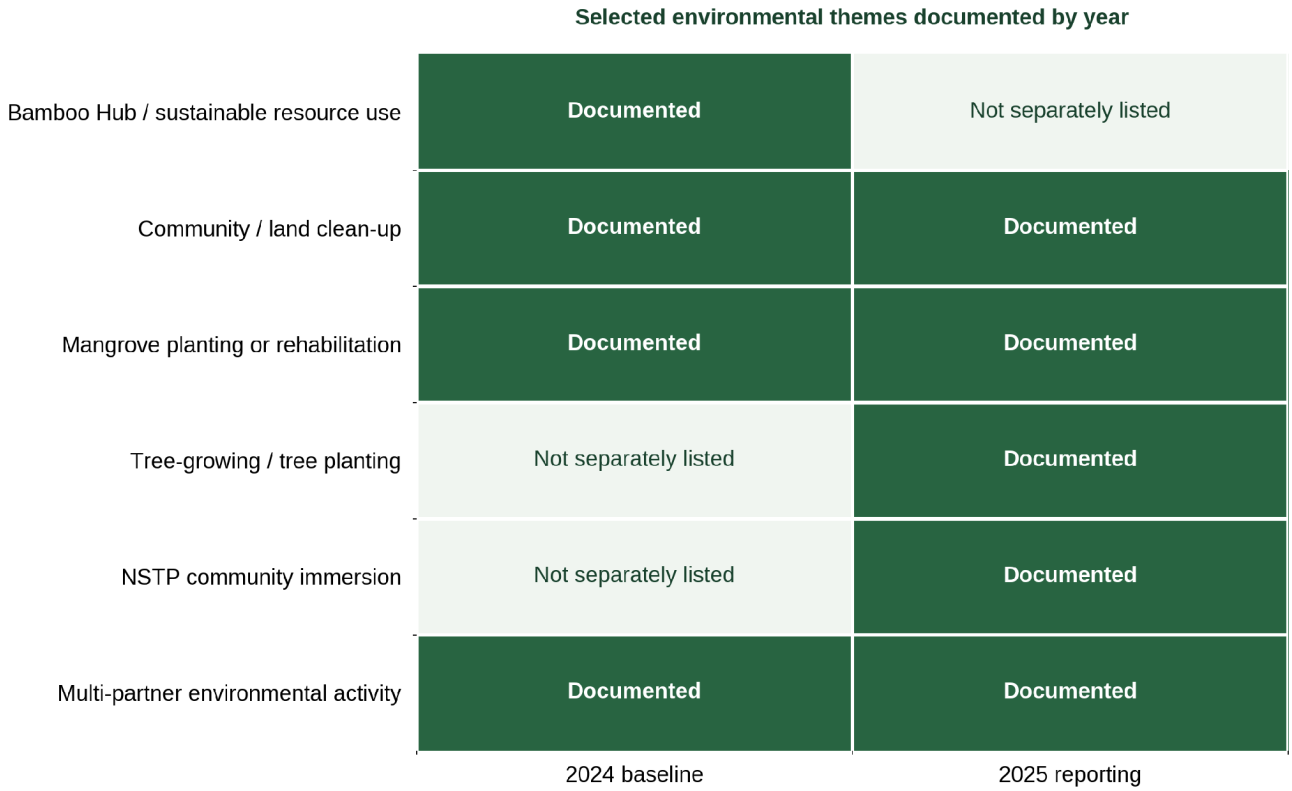

Figure 1. Themes explicitly described in the supplied 2024 baseline and 2025 activity narrative. "Not separately listed" means the theme was not identified as a distinct activity in that year's reviewed material.

Interpretation: The 2024 materials are clear about sustainable bamboo resource development and local clean-up participation, and the combined source record identifies a 2024 mangrove planting activity. The 2025 material more explicitly describes tree-growing, mangrove rehabilitation, coastal clean-ups, and NSTP service-learning. Multi-partner engagement is visible in both periods but becomes more detailed in the 2025 activity narratives. The figure compares documented themes rather than proving that a theme was absent from all institutional activity in a given year.

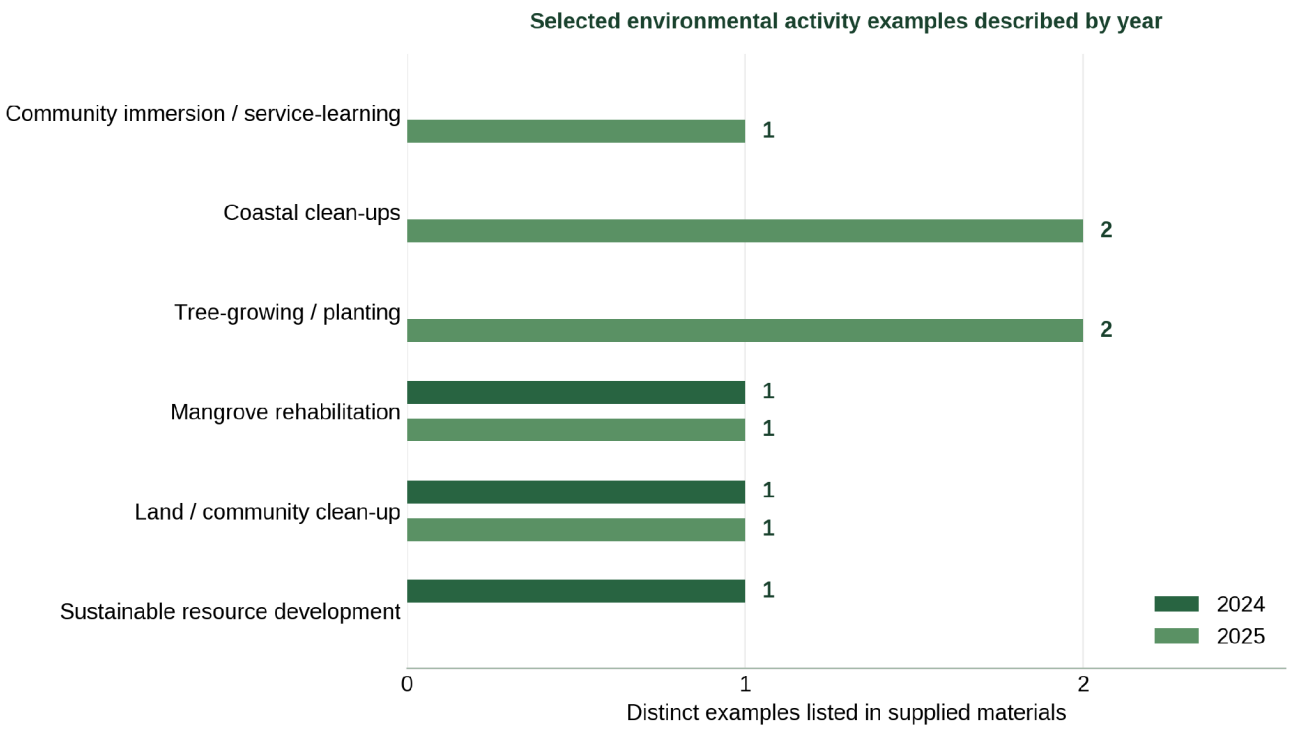

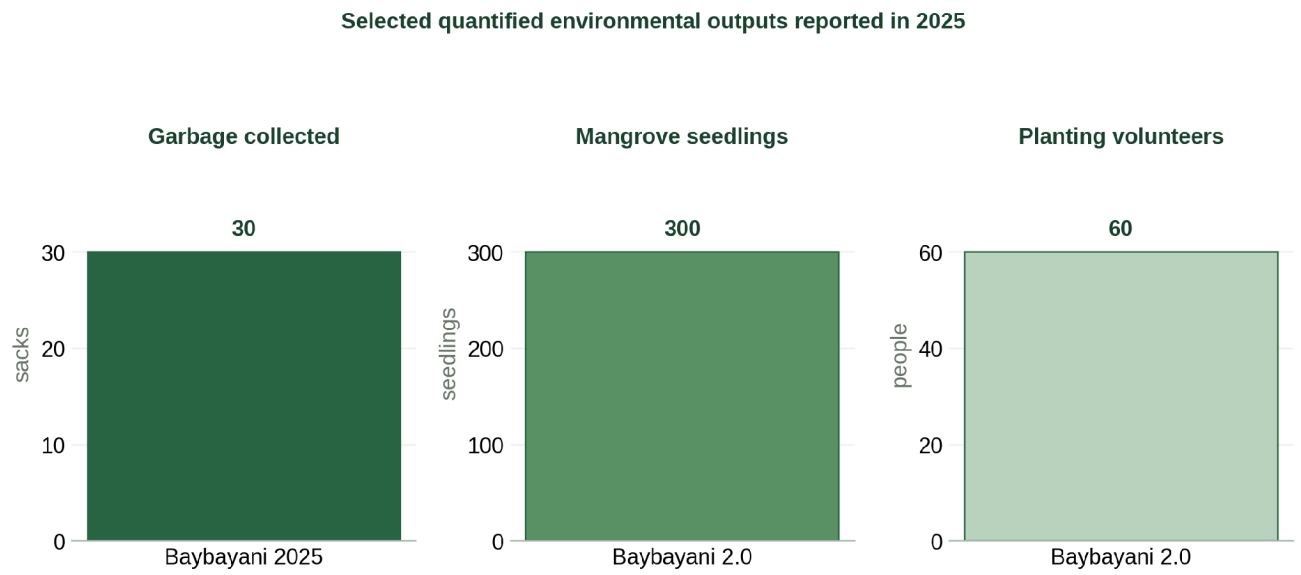

Figure 2. Selected distinct activity examples grouped by broad theme. Counts reflect the examples listed in the supplied sources and are not official annual totals or measures of environmental impact.

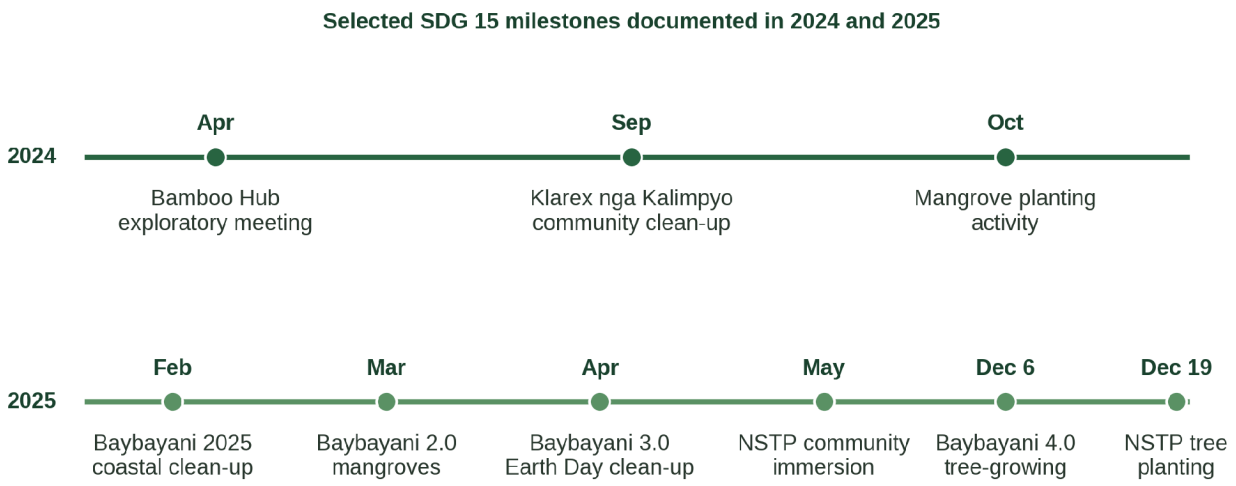

Interpretation: The 2024 baseline has one selected example each for sustainable resource development, community clean-up, and mangrove planting. The 2025 narrative lists two tree-growing/tree-planting examples, two named coastal clean-ups, one mangrove rehabilitation activity, and one community immersion with a clean-up component. This pattern illustrates the greater specificity and breadth of the 2025 activity description. Since categories are coded from the supplied narrative and can overlap in their aims, the chart should be read as an inventory of described examples, not as a percentage increase in ecosystem restoration.

Units are different; values are shown separately and must not be added together.

Figure 3. Quantified outputs reported for two selected 2025 activities. The three measures use different units and are presented separately.

Interpretation: Baybayani 2025 documented 30 sacks of garbage collected across three coastal areas and nearly 50 participating faculty and staff members alongside residents. Baybayani 2.0 documented 300 mangrove seedlings planted by 60 volunteers. These values provide a clearer numerical picture of selected 2025 implementation than is available in the supplied 2024 baseline. They should not be added into one score because sacks of waste, seedlings, and volunteers measure different things. Their value is in showing that the 2025 narrative contains both physical outputs and participation records.

Milestone timeline; not every institutional environmental activity is represented.

Figure 4. Timeline of selected milestones documented in the 2024 and 2025 reports. The timeline is selective rather than a complete calendar of every environmental activity.

Interpretation: The timeline shows an evolution across reporting periods. The 2024 activities centered on resource-use planning, local cleanliness, and a mangrove planting event. By 2025, CCCDO had named environmental activities across February, March, April, May, and December, including repeated clean-up activity, mangrove rehabilitation, community immersion, and tree-growing. The distribution across the year demonstrates that the 2025 narrative presents environmental stewardship as a continuing series of activities rather than one isolated event.

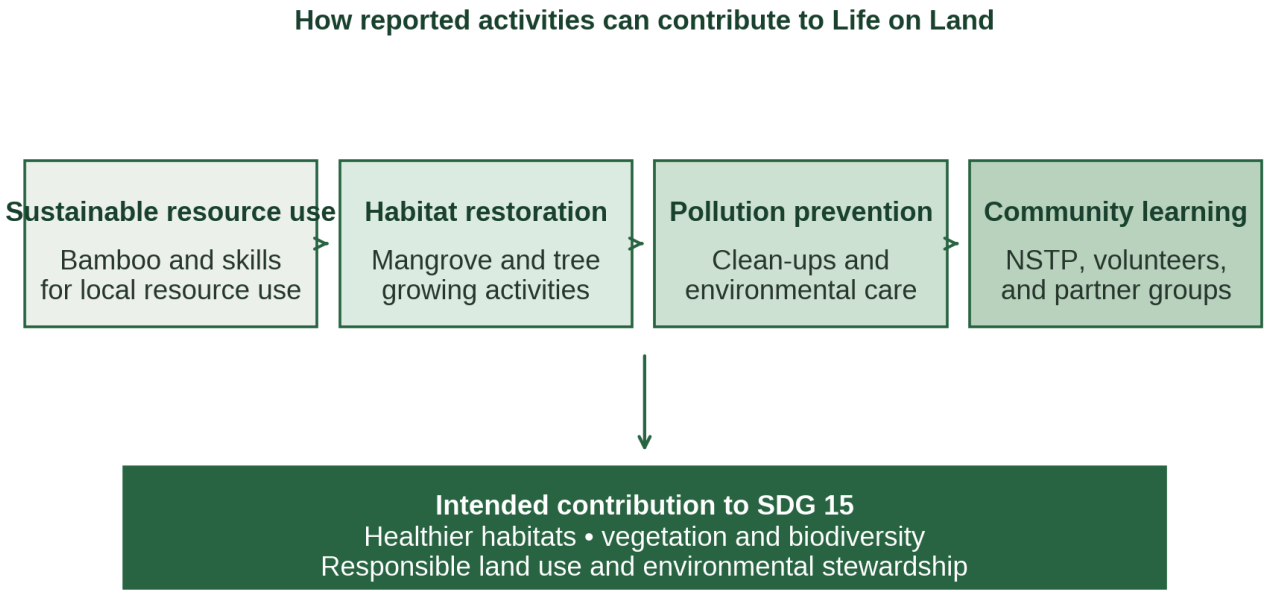

Figure 5. Conceptual pathway linking the reported activity types to the intended contribution of SDG 15. The diagram illustrates contribution logic, not a measured ecological outcome.

Interpretation: The figure connects four complementary strands: sustainable resource use through bamboo development; restoration through mangrove and tree planting; pollution prevention through clean-ups; and environmental learning through NSTP, volunteers, and partners. Together, these activities can support healthier habitats and responsible land use. The intended contribution becomes lasting ecological change only through appropriate implementation and continued ecosystem response; the source material directly documents activities and selected outputs, not a quantified change in biodiversity or land condition.

Comparative Overview of Institutional Progress

Area of contribution	2024 baseline	2025 documented activity	Comparative interpretation
Sustainable resource use	Exploratory Bamboo Hub meeting in Mambuaya; commitment to TESDA-accredited Bamboo Engineering NC II and Bamboo Processing NC II qualifications.	The supplied SDG 15 narrative emphasizes restoration, tree-growing, clean-ups, and service-learning rather than a new bamboo milestone.	The 2024 record foregrounds sustainable use of a renewable resource and skills development; the 2025 account foregrounds direct environmental action.
Community and land cleanliness	Participation in “Klarex nga Kalimpyo sa Kadalanan ug Tugkaran” in Barangay Consolacion.	Baybayani 2025 and Baybayani 3.0; clean-up activity also formed part of NSTP community immersion and Baybayani 4.0.	Clean-up remained a visible form of stewardship, with more specifically named activities and multi-partner participation in 2025.

Area of contribution	2024 baseline	2025 documented activity	Comparative interpretation
Mangrove rehabilitation	A 2024 mangrove planting activity at Bonbon is identified in the supplied historical account.	Baybayani 2.0 planted 300 seedlings with 60 volunteers in Barangay Pangayawan, Gitagum.	Mangrove conservation continues across years, with the 2025 record offering a concrete seedling and volunteer count.
Tree-growing and vegetation	The 2024 report refers to institutional support for environmental care and mentions tree planting/clean-up in planning context, but does not detail a comparable tree-growing activity.	Baybayani 4.0 on December 6 and NSTP Tree Planting Activity on December 19 in Macasandig.	Tree-growing becomes a more explicit and distinct feature of the documented 2025 portfolio.
Student and community engagement	College personnel participated in community clean-up and resource-development discussions with external stakeholders.	NSTP students, youth volunteers, staff, residents, local government offices, and environmental organizations participated in activities across the year.	The 2025 narrative shows more varied examples of student service-learning and collaborative environmental work.
Quantified outputs	The 2024 SDG 15 baseline does not provide a comparable waste or seedling total in the supplied report text.	30 sacks of garbage across three coastal areas; 300 mangrove seedlings planted by 60 volunteers; nearly 50 faculty/staff reported at Baybayani 2025.	The 2025 sources offer more specific activity-level quantities, but these cannot be converted into a year-on-year growth rate without equivalent 2024 measures.

Alignment with SDG 15 Themes

The reported initiatives align with SDG 15 through several pathways. The Bamboo Hub initiative is connected to sustainable resource use because it frames a renewable land-based resource as part of skills development and local livelihood. The city clean-up campaign and the 2025 clean-ups support environmental care by removing waste from shared spaces and encouraging responsible behavior. Mangrove rehabilitation and tree-growing are the most direct restoration activities in the supplied record because they involve planting vegetation that can support habitat and ecosystem functions. NSTP community immersion and volunteer programs contribute through environmental learning and participation.

SDG 15 theme	Relevant CCCDO activities	Contribution described in the reports
Sustainable use of terrestrial resources	Bamboo Hub exploratory meeting and commitment to bamboo-related TESDA qualifications in 2024.	Links technical education and resource-based livelihoods with a renewable natural material.
Protection of habitats and biodiversity	2024 mangrove planting; Baybayani 2.0 mangrove rehabilitation; tree-growing and planting in December 2025.	Provides direct planting and restoration activities relevant to vegetation and habitat support.
Land cleanliness and reduced environmental pressure	2024 “Klarex nga Kalimpyo”; Baybayani 2025; Baybayani 3.0; cleanup components in community immersion and Baybayani 4.0.	Removes waste from public and coastal areas and encourages stewardship of surrounding ecosystems.
Environmental education and participation	NSTP service-learning, faculty and staff involvement, youth volunteerism, and CLENRO orientation.	Connects practical environmental work with student learning, civic responsibility, and community participation.
Partnership and local coordination	DTI/TESDA and farmer associations around the Bamboo Hub; CLENRO, Andam Higala Inc., CLIMBS, Kusgan Volunteers Inc., local offices and barangay partners in environmental activities.	Shows that environmental work is supported by coordination among education, government, community, and civil-society partners.

Institutional Contribution and Why the Progress Matters

The 2024–2025 record shows CCCDO connecting environmental protection with education, resource use, and community service. In 2024, the Bamboo Hub proposal highlighted that natural-resource sustainability includes the way local materials are developed and the skills available to workers and farmers. The clean-up campaign brought institutional personnel into practical community environmental work. The reported 2024 mangrove planting also established a restoration-related element ahead of the 2025 Baybayani activities.

The 2025 projects expanded the visibility of direct environmental participation. The documented 30 sacks of garbage from three coastal areas provide a concrete record of waste removed during Baybayani 2025. The planting of 300 mangrove seedlings by 60 volunteers records a tangible restoration action. Baybayani 3.0 extended collective environmental service on Earth Day, while the two December activities emphasized tree-growing and tree planting. Community immersion and NSTP participation created a link between environmental action and student learning.

These initiatives matter for CCCDO because terrestrial ecosystems support biodiversity, soil stability, water regulation, and the natural resources on which communities depend. Mangroves are particularly important at the boundary between land and sea, while trees and vegetation

contribute to habitat and soil protection. Clean-ups can reduce the amount of litter left in public spaces and natural environments. Resource-use initiatives connect environmental sustainability with livelihood and skill development. By combining these approaches, the College's documented work reflects a broad understanding of environmental stewardship that includes both practical action and education.

Conclusion

The comparative analysis of CCCDO's SDG 15-related activities in 2024 and 2025 shows continuity in environmental stewardship and a broader range of documented restoration and service activities in 2025. The 2024 baseline focused on sustainable resource development through the proposed Bamboo Hub, participation in the city's community clean-up campaign, and a reported mangrove planting activity. These initiatives connected resource use, community cleanliness, and environmental awareness with the College's education and service mission.

In 2025, the College's activities were described in greater detail across the year. Baybayani 2025 collected 30 sacks of garbage across three coastal areas; Baybayani 2.0 recorded 300 mangrove seedlings planted by 60 volunteers; Baybayani 3.0 brought college members and external partners together for an Earth Day clean-up; NSTP community immersion included community clean-up; and Baybayani 4.0 and the NSTP tree-planting activity added distinct tree-growing and vegetation-related activities in December. The documented portfolio thus broadened from resource-development planning and community cleanliness toward more explicit habitat restoration, volunteerism, and environmental service-learning.

The central interpretation is that CCCDO's 2025 contribution to Life on Land became more visibly activity-based and collaborative while continuing themes present in 2024. These activities matter because sustainable land management depends on responsible resource use, protection and restoration of habitats, reduced environmental pressure, and the participation of informed communities. The supplied sources support this conclusion through dated initiatives, partner involvement, and selected output figures; they do not quantify the overall change in biodiversity or long-term ecosystem condition.
