SDG 2: ZERO HUNGER PROGRESS REPORT

Food security, adequate nutrition, and sustainable food systems are essential to sustainable development. Sustainable Development Goal 2 (SDG 2), or Zero Hunger, aims to end hunger, achieve food security, improve nutrition, and promote sustainable agriculture. Higher education institutions can contribute through research, technological innovation, academic collaboration, and community engagement that address food-system challenges and support local development.

This report examines City College of Cagayan de Oro's (CCCDO) reported contributions to Sustainable Development Goal 2 (SDG 2): Zero Hunger during 2024 and 2025. SDG 2 concerns ending hunger, improving nutrition, and supporting sustainable and resilient food systems. These aims involve both immediate access to food and longer-term conditions that help households and communities maintain food security.

The supplied account describes two connected strands of work. The first is academic research and policy engagement: participation in the Mindanao Regional Scientific Meeting, recognition of research at the 6th NMSCST Research Congress, partnership in the National RITE 2 Project, participation in ITS CommTech Insight 2025, and benchmarking at Ateneo de Davao University. The second is community outreach and social empowerment: Gasa ng Pag-asa, Community Feast 2025, TalenTrail 2.0, validation for the Search for Child-Friendly Barangays, partnership with Pilipinas Shell Foundation, Inc., and participation in the ACES Summit 2025.

The institutional sources available through December 2025 document a broader set of SDG-related activities than the 2024 examples initially summarized. This includes the 2024 Mindanao Regional Scientific Meeting and Gasa ng Pag-asa, followed by 2025 research recognition, technology exchange, youth training, child-friendly barangay validation, institutional partnerships, and a planned student fellowship meal. The broader list reflects documented activity, not proof that hunger declined or nutrition improved. Evidence of food-security outcomes remains limited; activity counts must not be treated as outcome measures.

The report therefore separates documented activities from their potential contribution and from outcomes that still require evidence. It includes a descriptive activity chart, a conceptual pathway diagram, a monitoring framework, a comparative table, and recommendations for improving future SDG reporting.

Key Findings

- CCCDO's reported approach combines research and policy engagement with direct community support and youth-focused skills development.
- The supplied 2025 narrative describes more activity examples across research and outreach than the 2024 narrative.

- Partnerships and academic forums can build capacity, but their longer-term value depends on follow-through, adoption, and documented results.
- Future reports should record who was reached, what was delivered, what changed, and whether changes lasted.

1. Institutional Overview and SDG 2 Context

Institutional Research Capacity and Community Engagement

Two additional CCCDO sources help contextualize the institution's capacity to contribute to the SDGs. The December 18, 2024 article, “City College CDO, DOST Host Research and Development Agenda Workshop,” documents research planning with the Department of Science and Technology and other stakeholders. This is evidence of research-capacity development, not a measured food-security result. The November 4, 2024 article, “City College of CDO and Barangay Agusan Join Forces for Community Extension and Social Development Initiatives,” documents institutional coordination with a local community. It supports the community-extension context but does not, on its own, verify food distribution or a reduction in hunger. The December 16, 2025 article about CCCDO's national sustainability award at CHED ICONS 2025 provides broader institutional sustainability context, rather than a direct SDG 2 performance indicator.

City College of Cagayan de Oro describes its vision as being “a transformative institution of higher learning that advances inclusive, resilient, and sustainable communities.” The College’s SDG 2 contribution can be understood through the relationship between education, research, public engagement, and practical community support.

Food security is broader than the availability of food. It also depends on whether people can access food, whether food is affordable and nutritious, whether communities have the knowledge and resources to produce or obtain food, and whether the food system can withstand economic, social, and environmental pressures. This means that relief programs, nutrition-focused activities, skills development, research, and partnerships can support different parts of the same goal.

For a higher education institution, the connection between activities and SDG 2 should be explained through a clear results chain: resources support activities; activities produce immediate outputs; outputs may lead to outcomes; and outcomes may contribute to broader development impacts. Records, not assumptions, should support the strength of each link.

2. Academic Research and Policy Engagement

2.1 2024 Baseline: Mindanao Regional Scientific Meeting

The CCCDO institutional article listed as Article 771 documents the College's participation in the 2024 Regional Scientific Meeting, Mindanao Cluster. The report identifies the meeting's theme as “Beyond Farm Productivity: Transforming the Philippine Food System to Address Equity, Consumer Health, and Environmental Issues.” This provides a research and policy context for discussing food-system equity, consumer health, and environmental sustainability.

The event is a documented academic engagement; it is not direct evidence that local hunger or malnutrition decreased.

The supplied report states that the engagement strengthened curriculum development and research focus on digital agriculture, food-system equity, and environmental sustainability. It also states that the College contributed to policy resolutions informing regional strategies. Scientific meetings can help connect research, teaching, and policy discussion. To establish the extent of CCCDO's influence, future reports should identify the specific resolutions, the College's contribution, and whether the recommendations were adopted or implemented.

This meeting serves as the 2024 baseline described in the supplied material, not as a complete inventory of all CCCDO activities during that year.

2.2 2025 Expansion: Research and Collaboration

6th NMSCST Research Congress

The CCCDO article published November 8, 2025, reports dual Best Paper and Best Presenter recognition at the 6th NMSCST Research Congress. The article includes research on community extension and youth leadership that identifies food security among its intended development areas, alongside research on plant care and propagation. This supports the report's discussion of research recognition and knowledge development. Awards and stated research aims do not, by themselves, demonstrate that food access or nutrition improved.

The supplied report states that CCCDO researchers earned dual Best Paper and Best Presenter awards at the 6th NMSCST Research Congress in areas related to sustainable agriculture and food security. Research awards can indicate recognition of a study's quality, relevance, or presentation. They may also help research findings reach academic and institutional audiences.

An award, however, is evidence of recognition rather than proof of an improvement in food security. To demonstrate wider impact, CCCDO should record the paper titles, methods, findings, award categories, and any subsequent use of the research in teaching, community extension, policy, or practice.

National RITE 2 Project

CCCDO's official announcement confirms its approval as a research partner in the Research Initiatives in Teacher Education (RITE 2), a national program focused on teacher-education policy and practice. The announced projects concern teacher mentorship and Indigenous/contextualized pedagogies, rather than food-system resilience directly. This source therefore demonstrates research capacity and institutional partnership, but its SDG 2 relevance is indirect and should not be presented as a direct food-security intervention.

Assess the value of a project partnership against clear responsibilities and deliverables. CCCDO could document its assigned role, outputs completed, partner coordination, timelines, and the practical use of results. These details would make the College's contribution more visible and accountable.

ITS CommTech Insight 2025

CCCDO's official article describes the participation of its Research Director in the Community and Technological (CommTech) Camp Insight 2025 at Institut Teknologi Sepuluh Nopember in Indonesia. The program focused on technology-driven solutions for societal challenges and the Sustainable Development Goals. The article does not specifically document a fisheries or digital-agriculture demonstration by CCCDO, so the activity is best described as an international technology and knowledge-exchange opportunity with an indirect potential connection to sustainable development.

A stronger activity record would identify the technology demonstrated, the problem it was intended to address, the audience reached, and any subsequent pilot, adoption, or follow-up activity.

Benchmarking at Ateneo de Davao University

The official article describes CCCDO's April 2, 2025 benchmarking visit to Ateneo de Davao University, focused on quality assurance, institutional promotions, partnerships, and lifelong learning. It does not identify food security as a specific focus of the visit. It may be cited as evidence of institutional learning and collaboration, but its connection to SDG 2 is indirect unless further documentation establishes a food-security application.

To show the value of the visit, CCCDO could list the practices reviewed, lessons selected for implementation, responsible offices, deadlines, and progress after six or twelve months. Without follow-up, the visit remains a learning activity rather than evidence of institutional change.

2.3 How Research Can Contribute to Zero Hunger

Research and policy engagement generally contribute indirectly. They may improve the evidence available to decision-makers, strengthen curriculum and extension work, encourage innovation, and align programs with local needs. Their connection to food security becomes clearer when research findings are used in a policy, training, service, technology, or practical decision.

A useful results chain is: research activity → research output → application or uptake → change in practice or decision → possible food-security benefit. Each stage should be documented separately. A conference appearance or award is an output; demonstrated adoption of a finding is a different level of result.

3. Community Outreach and Social Empowerment

3.1 2024: Gasa ng Pag-asa

The official CCCDO article describes Gasa ng Pag-asa as a December 2024 outreach activity organized with student-affairs and student-government partners for the Barangay Agusan community. It confirms donated gifts and community support, but the article does not quantify food packages, the number of households served, or the nutritional value of assistance. A separate CCCDO-wide SDG report states that 80 families received food packages; this figure

should be cited to that report and verified against distribution records before being treated as an audited outcome.

The initiative also highlights social responsibility and solidarity through faculty, staff, and student participation. However, the supplied material does not state how many families or children were reached, the quantity of food distributed, or whether households continued to experience food insecurity after the activity.

For future editions, CCCDO could record unique households served, types and quantities of assistance, selection criteria, partner contributions, beneficiary feedback, and referrals for families who need longer-term support. Records should be aggregated and handled in a way that protects privacy and dignity.

3.2 2025: Community Feast 2025

CCCDO's December 9, 2025 announcement describes Community Feast as a planned, potluck-style fellowship lunch at the covered courts, inviting students from all blocks to share food and build campus connections. The announcement is evidence of the planned event, but does not confirm that it took place, how many students attended, or whether it addressed food insecurity. It should therefore be described as a planned campus community meal rather than a verified nutrition intervention unless completion records are available.

To assess its nutritional contribution, the College would need to document attendance, meal composition, food-safety procedures, and the frequency or continuity of support. One event should not automatically be described as reducing student hunger overall. Future assessment could examine whether students report improved access to meals and whether those with recurring food insecurity can access continuing support.

3.3 TalenTrail 2.0: Reintegration and Skills Development

CCCDO's June 14, 2025 article reports that 65 youth from reintegrated families participated in TalenTrail 2.0, a two-day career-development training held June 3–4 in Barangay Dansolihon. The documented focus was life skills, career direction, and confidence-building. The article does not establish that food-security awareness was part of the curriculum. The activity is therefore relevant to broader livelihood and social-development context, but its SDG 2 relationship is indirect.

Training attendance alone does not prove livelihood impact. A more complete assessment should track enrolment, attendance, completion, competencies acquired, mentoring access, and later use of the skills. Follow-up outcomes might include employment, an income-generating activity, or continued application of the training, where participants voluntarily agree to be contacted.

3.4 Search for Child-Friendly Barangays

The supplied report states that CCCDO played a validation role in the Search for Child-Friendly Barangays, with attention to nutrition and welfare standards. Validation can help assess whether local systems meet agreed criteria and can identify areas where child welfare services need improvement.

Future reporting should specify the validation framework, number of barangays assessed, criteria reviewed, recommendations issued, and follow-up actions completed. If nutrition is one element of a broader assessment, nutrition findings should be distinguished from other child-welfare indicators.

3.5 Pilipinas Shell Foundation, Inc. Partnership

CCCDO's official sources document coordination with Pilipinas Shell Foundation, Inc. beginning in 2024 and a 2025 recognition connected with the foundation's SKIL technical-vocational training program. The December 2025 article highlights 24 EIM NC II scholars and opportunities for training, industry exposure, financial assistance, and employment support. These records support a partnership and youth-livelihood narrative; they do not establish a nutrition-focused project or a direct food-security outcome.

The partnership’s contribution would be clearer if the report named the relevant project, period, partner roles, documented resources, outputs delivered, beneficiary groups, and monitoring arrangements. Financial or in-kind contributions should be reported only where supported by records.

3.6 ACES Summit 2025

The supplied narrative mentions participation in ACES Summit 2025, but the source list should retain this claim only if the corresponding original CCCDO article or event record is available and verifies the activity and its relevance. Until then, it should be treated as unverified in this report.

To demonstrate follow-through, CCCDO could record the sessions attended, useful practices identified, partnerships initiated, and actions taken after the summit. Attendance is an activity; documented collaboration or implementation demonstrates progress beyond attendance.

3.7 From Immediate Relief to Long-Term Resilience

The community initiatives described in the report operate at different points on a continuum. Food and material assistance may address immediate hardship. Shared meals can provide short-term food support and strengthen community belonging. Youth reintegration and skills development may help address longer-term barriers to livelihood security. Validation and partnerships can strengthen local systems and coordination.

These approaches are complementary but should not be assessed in the same way. Measure relief through reach, timeliness, adequacy, and recipient experience. Assess training through learning and subsequent use of skills. Assess partnerships through shared outputs and follow-through. Food-security outcomes require evidence about access to sufficient, safe, and nutritious food over time.

4. Figures and Comparative Analysis

Figure 1. Reported Activity Examples by Year

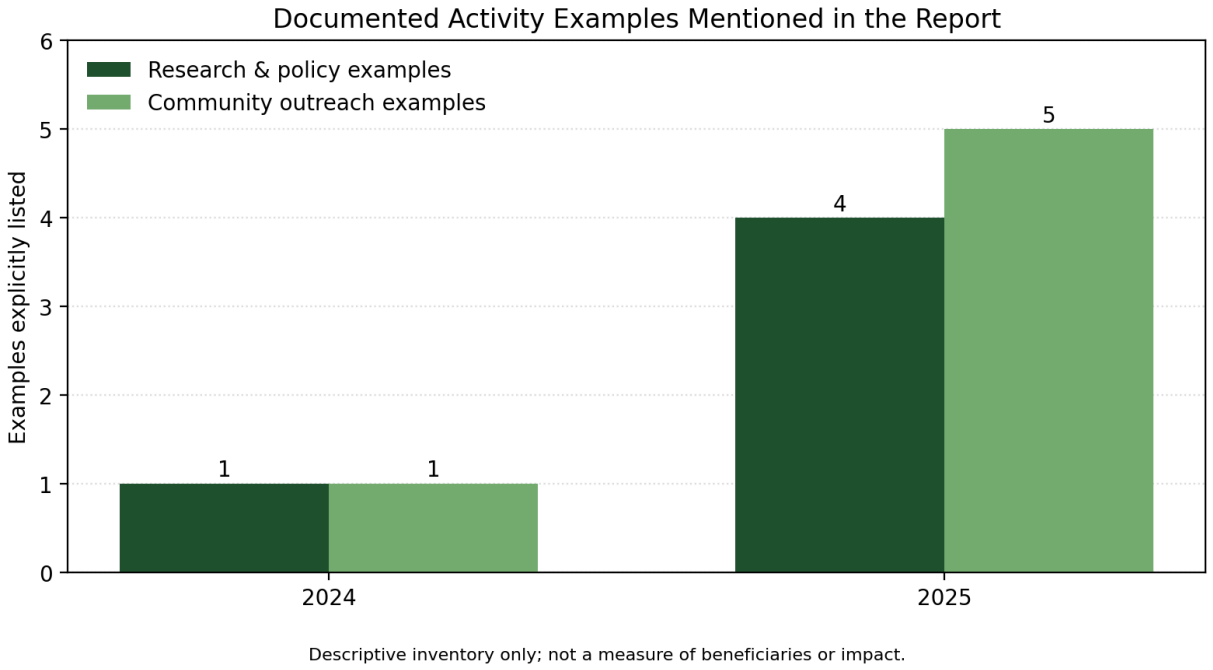

Figure 1. Counts are based only on distinct examples explicitly listed in the supplied narrative: one research/policy example and one outreach example for 2024; four research/policy examples and five outreach examples for 2025.

The chart shows that the source narrative lists more distinct activity examples for 2025 than for 2024. It is a descriptive count of examples mentioned in the report, not a verified institutional activity census. The 2025 list includes activities with indirect SDG 2 relevance and a December event announcement that describes a planned meal; these should not be counted as direct food-security outcomes.

The difference may reflect genuine expansion, more complete documentation in 2025, or both. Before using the chart as a formal institutional performance indicator, CCCDO should verify the activity inventory against official records and apply consistent criteria to both years.

Figure 2. Pathway from Activities to Intended SDG 2 Benefits

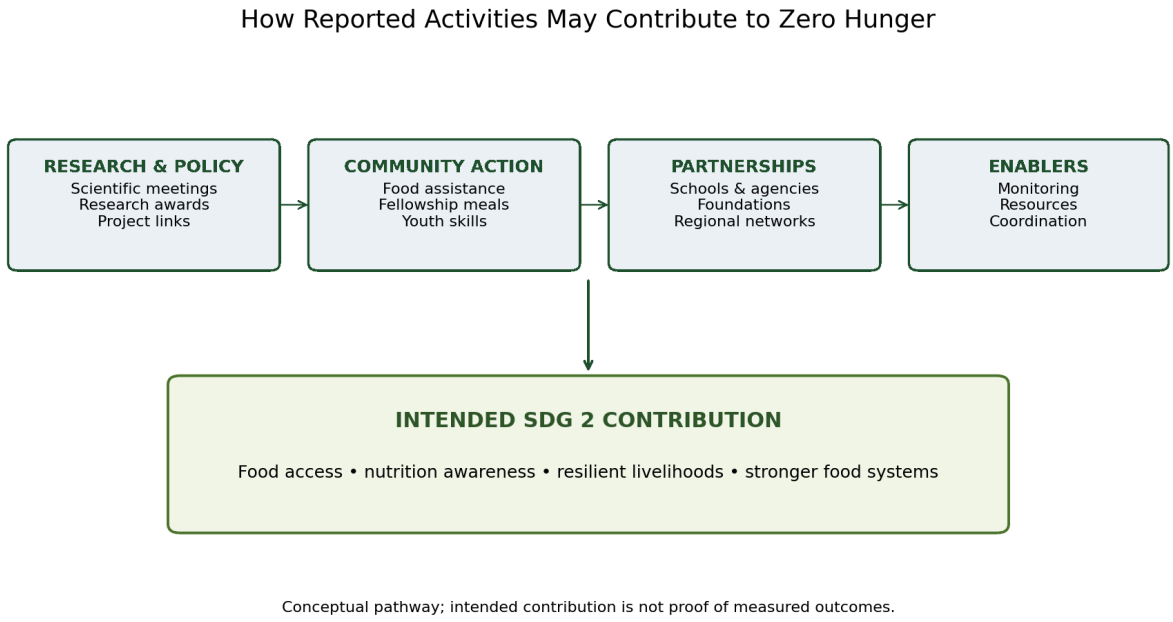

Figure 2. Conceptual model showing how research, community action, partnerships, and monitoring may contribute to intended Zero Hunger benefits.

The pathway illustrates that activities generally need resources, coordination, and follow-up to produce outcomes. A research presentation may create knowledge, but its contribution to food security becomes more direct when findings inform a decision or practice. A food-assistance event produces an immediate output, while its effect on food access depends on the adequacy of assistance and the needs of the people reached.

Figure 3. Recommended Monitoring Framework

Recommended Results-Measurement Framework

INPUTS	ACTIVITIES	OUTPUTS	OUTCOMES
Staff, partners, resources	Food support, research, training	People reached, meals, outputs produced	Food access, nutrition, livelihood resilience

Baseline and actual values must be collected and verified by CCCDO.

Figure 3. A results framework for future reporting. Responsible CCCDO offices should collect and verify baseline and endline values.

Inputs are resources; activities are the work performed; outputs are immediate deliverables; outcomes are changes experienced by participants or communities. Keeping these categories

separate prevents event counts from being presented as evidence of improved nutrition or food security.

5. Impact and Institutional Synergy

The report describes a model in which academic work and community outreach can reinforce one another. Research and policy engagement may improve the evidence base and institutional capacity. Community programs may reveal practical needs and provide opportunities to apply approaches. Partnerships may connect these strands with additional expertise and resources.

Year	Research & Policy Engagement	Community Outreach & Empowerment	Interpretation
2024	Mindanao Regional Scientific Meeting; reported contribution to policy resolutions and research focus	Gasa ng Pag-asa food, clothing, and gift assistance in Barangay Agusan	Baseline examples described; reach and outcome figures not supplied.
2025	NMSCST Research Congress awards; National RITE 2 Project; ITS CommTech Insight 2025; benchmarking visit	Community Feast 2025; TalenTrail 2.0; child-friendly barangay validation; Pilipinas Shell Foundation, Inc. partnership; ACES Summit 2025	Wider portfolio of examples described; beneficiary totals and measurable outcomes not supplied.

5.1 Institutional Strengths

- Cross-functional approach: reported work spans research, extension, partnerships, and student/community engagement.
- Attention to immediate and structural needs: relief and meals are paired with skills development, research, and collaboration.
- Potential for knowledge transfer: scientific meetings, technology forums, and benchmarking can help ideas move into practice.
- Opportunity to improve evidence: the activity narrative provides a starting point for consistent SDG 2 monitoring.

5.2 Evidence Gaps and Reporting Risks

- The report includes no verified beneficiary totals for food assistance, meals, training, or validation activities.
- The report provides no food-security or nutrition baseline and follow-up measures.
- The narrative does not consistently distinguish completed outputs from intended or longer-term outcomes.
- The supplied material does not quantify partnership roles, resource contributions, or follow-up actions.

- The 2024 and 2025 activity lists may not be equally comprehensive, limiting direct comparison.

6. Alignment with SDG 2 Themes

The following mapping is an analytical guide, not a claim that every activity has achieved a specific SDG target. Activities should be linked to targets only where their design and evidence support the relationship.

SDG 2 theme	Potentially relevant activities	Evidence needed
Ending hunger and improving food access	Gasa ng Pag-asa; Community Feast 2025	Unique beneficiaries, quantity and adequacy of food support, frequency, feedback, follow-up.
Improving nutrition	Community Feast 2025; child-friendly barangay validation; nutrition-focused partnership work	Meal or food-package composition, nutrition criteria, assessment findings, appropriate outcome measures.
Sustainable and resilient food systems	Mindanao Regional Scientific Meeting; National RITE 2 Project; ITS CommTech Insight 2025	Research outputs, technologies tested, adoption evidence, partner involvement, pilot results.
Knowledge and capacity-building	NMSCST Research Congress; TalenTrail 2.0; benchmarking; ACES Summit 2025	Research outputs, skills assessment, training completion, follow-up application, adopted practices.
Partnerships supporting food security	National RITE 2 Project; Pilipinas Shell Foundation, Inc.; regional and university collaboration	Formal roles, shared plans, documented contributions, joint outputs, accountability arrangements.

7. Recommendations and Forward Strategy

7.1 Establish a Common SDG 2 Results Register

CCCDO should maintain a central register of SDG 2-related projects and activities. Each entry should include the project title, reporting period, responsible office, location, intended group, partners, dates, outputs, supporting documents, and follow-up status. A common register can reduce duplicate counting and make annual comparisons more reliable.

7.2 Measure Reach and Adequacy of Food Support

For food assistance and meal programs, record unique people or households reached, meals or food packages delivered, contents and nutritional profile where appropriate, delivery period,

and recipient feedback. Use consistent definitions, protect personal information, and report aggregate results rather than identifying vulnerable participants.

7.3 Track Skills and Livelihood Outcomes

For TalenTrail 2.0 and similar programs, record enrolment, attendance, completion, demonstrated competencies, and post-training support. Where participants consent, follow up after a defined period to learn whether they used the skills or accessed livelihood opportunities. Report response rates and limitations so findings are not overstated.

7.4 Connect Research Outputs to Use

For research awards, scientific meetings, and technology forums, record research titles, output types, findings, intended users, and subsequent uptake. Evidence might include a policy citation, curriculum change, community training, pilot test, partner decision, or documented change in practice. Distinguish potential application from confirmed use.

7.5 Strengthen Partnership Accountability

For each partnership, document shared objectives, partner roles, agreed outputs, resources contributed, timelines, data responsibilities, and review processes. Contributions should be classified as financial, in-kind, technical, or personnel support and reported only when records are available.

7.6 Use a Consistent Annual Review Cycle

At year-end, the responsible unit should verify activity records, review output and outcome indicators, consult participants where appropriate, identify what worked and what did not, and publish a concise summary. Consistent definitions will make progress easier to interpret.

7.7 Recommended Monitoring Indicators

Area	Suggested indicator	Evidence/source	Frequency
Food assistance	Unique people/households reached; meals or packages delivered	Distribution records, attendance, inventory, partner reports	Per activity; annual
Nutrition	Share of meals meeting a defined standard; participant feedback	Menu review, food-safety records, voluntary feedback	Per program cycle
Youth skills	Enrolment, completion, demonstrated skills, follow-up status	Attendance, assessment, follow-up survey	Completion and 3–12 months later
Research	Outputs completed; awards; documented uptake	Papers, event records, policy or partner documents	Quarterly/annual
Partnerships	Joint outputs completed against plan	Agreements, work plans, minutes, deliverable records	Quarterly/annual

Food-security outcomes	Change in a consistently measured food-access or nutrition indicator	Appropriate baseline/endline survey or validated data	Baseline and follow-up

Targets and baseline values should be set only after CCCDO determines what can be measured reliably and what is appropriate for each program. Unlike activities should not be combined into one headline impact score without a clear methodology.

Conclusion

The institutional record available through December 2025 documents CCCDO participation in a regional scientific meeting and Gasa ng Pag-asa in 2024, followed by research recognition, technology exchange, youth career training, child-friendly barangay validation, institutional partnerships, and a planned campus fellowship meal in 2025. These activities vary in how directly they relate to SDG 2. The strongest direct evidence concerns food-system research discourse and community support; several other activities are indirect contributions to research capacity, livelihood development, or child welfare.

This portfolio is a useful foundation because food security is influenced by immediate access to food, nutritional quality, knowledge, livelihoods, and the resilience of local systems. The next stage is to strengthen the evidence connecting institutional activities to changes experienced by students, families, youth, and partner communities.

The central conclusion is that CCCDO's institutional sources document several activities with varying degrees of relevance to SDG 2 through December 2025. The record supports reporting on participation, research recognition, community outreach, and selected youth-development activities. It does not, by itself, establish a measurable reduction in hunger or improvement in nutrition. Stronger conclusions require verified distribution records, attendance and completion data, food-security indicators, and follow-up evidence.
