SDG 12: RESPONSIBLE CONSUMPTION AND PRODUCTION PROGRESS REPORT

Sustainable Development Goal 12 (SDG 12), *Responsible Consumption and Production*, promotes the efficient and sustainable use of natural resources, waste prevention, pollution reduction, and responsible practices in production, purchasing, and everyday consumption. For higher education institutions, this goal extends beyond classroom instruction to include institutional operations, skills development, research, and community engagement. Colleges can contribute by promoting sustainable resource use, incorporating environmental considerations into procurement, supporting sustainable livelihood opportunities, and encouraging students and communities to adopt environmentally responsible practices.

In 2024, the City College of Cagayan de Oro (CCCDO) advanced SDG 12 through initiatives related to sustainable production and responsible institutional purchasing. These included participation in an exploratory meeting for a proposed Bamboo Hub in Barangay Mambuaya, with a commitment to support Technical Education and Skills Development Authority (TESDA)-accredited bamboo qualifications. The College also strengthened awareness of environmentally responsible purchasing through the Finance Division's participation in the 4th National Summit on Government Procurement, where Green Public Procurement (GPP) was discussed.

In 2025, CCCDO broadened its efforts through coastal clean-ups, plastic-reduction awareness activities under the National Service Training Program (NSTP), community leadership training conducted with WWF-Philippines and the City Local Environment and Natural Resources Office (CLENRO), a formal partnership with WWF-Philippines, and a learning visit involving Department of Education officials. These activities expanded the College's approach to sustainability by connecting environmental action with education, institutional cooperation, and community participation.

This report examines CCCDO's SDG 12 initiatives in 2024 and 2025, focusing on how its activities developed and why they matter for sustainable resource management, waste reduction, and responsible consumption. It also distinguishes activities conducted and their immediate outputs from longer-term outcomes, such as reduced plastic consumption, improved waste segregation, and the adoption of more sustainable purchasing practices.

Executive Assessment

The comparison of CCCDO's SDG 12 initiatives in 2024 and 2025 indicates a broader approach to responsible consumption and production. In 2024, the College emphasized sustainable production planning, local resource utilization, and awareness of environmentally responsible procurement. In 2025, it expanded its activities through coastal clean-ups, plastic-reduction awareness, community training, and environmental partnerships. This development reflects an approach that combines institutional planning with direct community engagement.

In 2024, CCCDO participated in an exploratory meeting for the proposed Bamboo Hub in Barangay Mambuaya. The initiative connected the potential use of a locally available resource with skills development and livelihood opportunities. Bamboo can serve as a renewable material for various products when cultivated, harvested, and processed responsibly. Supporting TESDA-accredited bamboo qualifications could also help develop practical skills relevant to sustainable production and local enterprise. The initiative therefore presented an opportunity to connect environmental responsibility with technical education, resource efficiency, and community economic development. However, participation in the exploratory meeting and the commitment to support relevant qualifications should be distinguished from the actual establishment or operation of the proposed hub.

The College also promoted awareness of responsible institutional purchasing through the Finance Division's participation in the 4th National Summit on Government Procurement. Discussions on Green Public Procurement highlighted the importance of considering environmental factors when acquiring goods and services. GPP can encourage institutions to consider product durability, resource efficiency, packaging, waste generation, and environmental impacts throughout a product's life cycle. This is relevant to CCCDO because purchasing decisions involving office supplies, equipment, learning materials, and services can influence resource consumption and waste generation across campus operations. Participation in the summit provided an opportunity to strengthen awareness, although further evidence would be needed to determine how extensively green procurement principles were incorporated into the College's actual purchasing practices.

In 2025, CCCDO expanded its focus on waste reduction and environmental responsibility through community-based activities. Baybayani 2025 collected 30 sacks of garbage across three coastal areas, with nearly 50 faculty and staff members participating alongside local residents. The activity provided a practical response to waste pollution while encouraging shared responsibility for maintaining cleaner coastal environments. Baybayani 3.0 continued the College's clean-up efforts during Earth Day, reinforcing environmental participation and the importance of collective action in caring for public spaces and coastal areas.

These clean-up activities contributed to the removal of existing waste from the environment. Their broader contribution to SDG 12, however, also depends on whether they encourage changes in waste generation, disposal, and consumption. Collecting discarded materials can help address visible pollution, but preventing waste at its source remains essential. Continued efforts to reduce unnecessary packaging, avoid single-use plastics, segregate waste properly, and promote reuse can complement clean-up activities and support more responsible consumption over time.

CCCDO also connected practical environmental action with awareness-raising through REAL TALK 1, which combined a clean-up activity with the “Ooopss, Bawal Plastik!” awareness session. This approach linked the removal of waste with discussions about reducing plastic use. Such activities are relevant to SDG 12 because responsible consumption involves considering the environmental effects of everyday choices before waste is produced. Through NSTP-related initiatives, students had opportunities to connect civic responsibility with practical environmental concerns and reflect on how individual and collective behavior can contribute to waste prevention.

Community education and partnerships further broadened the College's efforts. Through the GREEN Learning Series and collaboration with WWF-Philippines and CLENRO, CCCDO conducted sustainability learning activities involving barangay leaders, volunteers, and stakeholders engaged in solid waste management. These initiatives supported knowledge-sharing and strengthened attention to community-level environmental responsibilities. This is important because effective waste management relies on coordination among households, local leaders, educational institutions, and government offices. Community training can help stakeholders understand sustainable practices and their respective roles, although the lasting effects depend on whether the knowledge gained is applied and sustained after the activities.

The formal partnership with WWF-Philippines and the learning visit involving Department of Education officials also created opportunities for institutional cooperation and the exchange of sustainability knowledge. Partnerships can help extend environmental initiatives beyond individual events by connecting institutions with relevant expertise, resources, and networks. Engagement with education-sector stakeholders can also support the wider promotion of sustainability principles through learning activities and community programs. The extent of these contributions, however, should be assessed through evidence of subsequent joint activities, continued participation, and the application of shared knowledge.

Across the two years, CCCDO's initiatives covered complementary aspects of SDG 12. The 2024 activities focused on sustainable production planning and awareness of environmentally responsible procurement, while the 2025 initiatives placed greater emphasis on waste reduction, plastic awareness, community learning, and environmental partnerships. Sustainable production and green procurement address resource use and environmental considerations before waste is generated, while clean-ups and community education respond to existing waste and encourage more responsible practices. Together, these activities show how the College approached responsible consumption and production through institutional engagement and community-based action.

The available information provides evidence of CCCDO's participation in SDG 12-related activities and identifies immediate outputs, including the collection of 30 sacks of garbage across three coastal areas. However, these outputs alone do not establish sustained reductions in waste generation or coastal pollution. Similarly, participation in procurement discussions, awareness sessions, and sustainability training does not automatically demonstrate lasting changes in purchasing decisions, consumption patterns, waste segregation, or recycling practices. Assessing progress in these areas would require additional indicators, such as the adoption of green procurement criteria, changes in single-use plastic consumption, quantities of materials reused or recycled, and continued community participation in waste-management programs. These evidence-based distinctions provide a basis for identifying the report's key findings.

Key Findings

- The 2024 baseline addressed both sides of SDG 12: sustainable production through the proposed Bamboo Hub and responsible consumption through Green Public Procurement learning.
- The Bamboo Hub activity was exploratory, and the report described a commitment to open TESDA-accredited Bamboo Engineering NC II and Bamboo Processing NC II

qualifications; it should not be interpreted as proof that the Hub or training programs were already fully operational.
- In 2025, the documented focus expanded toward waste prevention, coastal clean-up, plastic-reduction awareness, community leadership, and environmental partnerships.
- Baybayani 2025 reported 30 sacks of garbage collected from three coastal areas, alongside nearly 50 CCCDO faculty and staff and participating local residents.
- The sources show a broader range of documented activities in 2025, but the different nature of the 2024 and 2025 records means that activity examples should not be interpreted as an official percentage increase in SDG 12 performance.

Institutional Context and SDG 12

Responsible consumption and production requires attention to the full life cycle of resources: how materials are sourced, how products are made and purchased, how they are used, and how waste is handled afterward. The 2024 initiatives were relevant to the first parts of this cycle. Bamboo, as a renewable resource, can form the basis of resource-efficient products and local livelihood activity when production is managed responsibly. Green Public Procurement can help a public institution consider environmental impacts in purchasing decisions, including the products and services used in daily operations.

The 2025 activities placed more emphasis on waste after consumption and on the behaviors and systems that influence disposal. Clean-up campaigns removed accumulated waste from public coastal areas, while “Ooopss, Bawal Plastik!” and the GREEN Learning Series addressed awareness, leadership, and local solid-waste-management practices. These efforts complement the earlier resource-development and procurement strands: sustainable consumption is strengthened when institutional purchasing, daily behavior, waste handling, and community capacity are treated as connected parts of sustainability.

The SDG 12 alignment in this report is interpretive. The named activities are discussed in relation to responsible resource use, sustainable public procurement, waste prevention, and awareness of sustainable lifestyles. Alignment demonstrates relevance to the Goal; it does not imply that each initiative independently achieved a measured SDG-level outcome.

The 2024 Baseline: Sustainable Production and Responsible Procurement

Bamboo Hub exploration in Mambuaya

On April 3, 2024, CCCDO participated in an exploratory meeting concerning the establishment of a Bamboo Hub in Barangay Mambuaya. The event, reported by the College on April 8, involved stakeholders including the Department of Trade and Industry Region X, TESDA Region X, the Mambuaya Integrated Social Forestry Farmers Association, and local government offices. Discussion centered on trends, innovations, and good practices in the bamboo industry and on the potential to generate income, particularly for farmers. [1]

CCCDO’s stated commitment was to support the emerging industry through TESDA-accredited qualifications in Bamboo Engineering NC II and Bamboo Processing NC II. This is significant because it connects technical-vocational education with a regional material resource and with the skills needed to process and use that resource. In SDG 12 terms, the initiative represents a production-side approach: education can help build local capability around renewable materials and potentially reduce dependence on less sustainable inputs, depending on how products and supply chains are subsequently developed.

The 2024 record describes an exploratory meeting and a commitment to support training; it does not state that the Hub was fully established or that the proposed qualifications had already produced a cohort of graduates. Its contribution is therefore best characterized as strategic groundwork for sustainable production and skills development, rather than a completed production output.

Green Public Procurement and institutional consumption

CCCDO's Finance Division participated in the 4th National Summit on Government Procurement, held on April 29–30, 2024, in Iloilo City and reported by the College on May 7. The delegation included finance, budget, payroll/procurement, and procurement personnel. Organized by the Philippine Institute of Certified Public Accountants, Inc., the summit covered procurement processes and emphasized Green Public Procurement as a way to make purchasing more sustainable across supply chains and organizational operations. [2]

This initiative is relevant to SDG 12 because procurement shapes what an institution buys, the standards it requires from suppliers, and the waste or environmental effects associated with its operations. The summit gave CCCDO personnel exposure to ways of considering environmental criteria alongside cost, planning, and operational needs. As a staff-development activity, it helped build knowledge and institutional readiness for more responsible purchasing. The source describes knowledge gained and future alignment potential, rather than a verified change in procurement rules or a measured reduction in purchasing-related waste.

What the 2024 baseline established

Together, the Bamboo Hub exploration and the procurement summit placed SDG 12 within both the College's external role and its internal operations. The Bamboo Hub proposal concerned the skills and stakeholder relationships that could support a sustainable local resource industry. GPP learning concerned the College's own purchasing and supply chain. This two-part approach is important because responsible consumption and production cannot be addressed solely through clean-up activities: it also depends on upstream choices about materials, product development, and institutional spending.

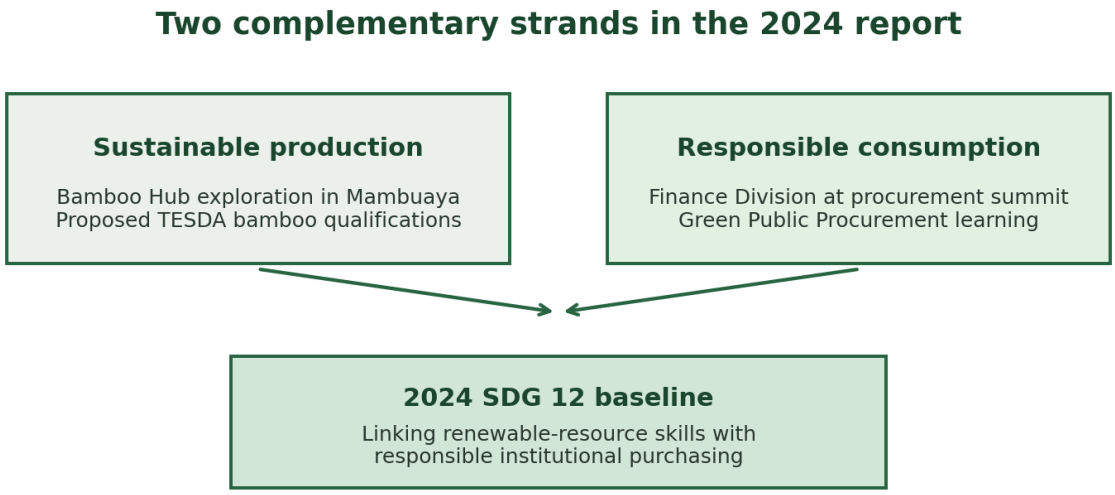

Figure 1. The two complementary pillars emphasized in CCCDO's 2024 SDG 12 report.

Interpretation: Figure 1 illustrates the structure of the 2024 baseline rather than a numerical performance score. The Bamboo Hub discussions represented a production-side pathway through renewable-resource development and technical qualifications, while the procurement summit represented a consumption-side pathway through environmental considerations in public purchasing. Their significance lies in the connection between education, resource use, and institutional practice.

Progress documented in 2025

Baybayani 2025: Klarex nga Kalimpyo

Baybayani 2025 was conducted on February 28, 2025, in Barangay Agusan and Barangay Consolacion in Cagayan de Oro City. The College article, published on March 19, reports that volunteers visited three coastal areas and collected 30 sacks of garbage. Nearly 50 CCCDO faculty and staff members participated alongside local residents.

This activity provides a concrete example of direct environmental action in the 2025 portfolio. Removing waste from coastal areas can improve the cleanliness of shared public spaces and reduce the amount of litter left in the environment. In SDG 12 terms, it highlights the consequences of waste that has not been responsibly managed and reinforces the role of communities in taking responsibility for materials after use. The reported sack count is an immediate clean-up output; it should not be treated as a measure of total waste generation or as proof of long-term pollution reduction.

Baybayani 3.0: Earth Day coastal clean-up

On April 22, 2025, CCCDO participated in Baybayani 3.0 at the Agusan coastal areas in celebration of Earth Day. The activity involved faculty, staff, and NSTP student volunteers, together with a wide group of partners including CLIMBS Cares, Plastik Republic, DENR Region X, Opol Community College, MASSPECC, CLENRO, Kusgan Volunteers Inc., the Bureau of Fire Protection, Coop NATCCO, and the Agusan Barangay Council. [5]

The continuation of coastal clean-up work through a second named Baybayani activity suggests that community waste management was not confined to a single event in the documented 2025 program. The broad partner group also shows that responsible waste practices involve more than individual action: educational institutions, barangays, public agencies, cooperatives, and environmental organizations can bring different types of capacity to a shared activity. The source emphasizes participation and collaboration; it does not provide a comparable waste-collection total for Baybayani 3.0.

REAL TALK 1: Plastic-reduction awareness and practical action

REAL TALK 1: “Prep Like a Pro, Ooopss Bawal Plastik!, and No Thanks!” took place on October 24, 2025, and was reported on October 28. The NSTP-related activity involved Civic Welfare Training Service and Literacy Training Service students and included a clean-up drive in designated areas within and outside the campus. Karen Mishelle Daba Camaro-Mapano of CLENRO delivered the “Ooopss, Bawal Plastik!” discussion, encouraging students to reduce plastic use and adopt more sustainable practices.

This activity connected environmental education with participation. The clean-up component gave students an opportunity to act on the issue of waste in their immediate surroundings, while the plastic-reduction session addressed the choices that can influence how much disposable material enters the waste stream in the first place. This combination is relevant to

responsible consumption because it links the visible consequences of disposal with the everyday decisions that produce waste. The source does not quantify plastic use before and after the activity, so its documented contribution is educational and participatory rather than a measured reduction in plastic consumption.

WWF-Philippines partnership and the GREEN Learning Series

CCCDO and WWF-Philippines formalized their collaboration through a ceremonial Memorandum of Agreement signing on June 18, 2025. The institutional narrative presents the partnership as part of the College's wider sustainability and community-leadership engagement. The partnership creates a channel for connecting educational expertise with environmental advocacy and community learning.

The GREEN Learning Series, reported in March 2025, shows the practical education strand of this collaboration. CCCDO worked with WWF-Philippines and CLENRO to support barangay leaders, volunteers, and stakeholders involved in solid waste management. The sessions addressed leadership, community visioning, and financial literacy. This approach recognizes that responsible waste management needs not only awareness but also local leadership, coordination, planning, and the capacity to organize activities within a community.

The partnership also extended to learning sessions in Caloocan and Quezon City, reported on July 1, 2025. These sessions brought together barangay leaders, solid-waste-management focal persons, and waste workers under WWF-Philippines' No Plastics in Nature initiative. The work therefore reached beyond CCCDO's campus and immediate city context, providing opportunities for knowledge exchange with people who have direct responsibilities in community waste practices. [8]

Why this matters: sustained progress in responsible consumption and production depends on practices that can be understood and organized by communities, not only on one-time clean-up drives. The partnership and learning series broadened CCCDO's contribution from participating in environmental action to supporting the leadership and learning that can help communities organize waste-related efforts. The cited materials document the partnership and activities; they do not attribute a specific quantity of waste reduction to the collaboration.

Sustainability learning visit for DepEd officials

On October 9, 2025, CCCDO hosted Department of Education officials representing 12 regions for a learning visit, reported on October 16. The visit included sessions on climate-change microcredentials, interactive learning courseware, the Bayanihan Outreach Program, and the Fresco Greenovation Laboratory, which showcases local agricultural technology and sustainability initiatives.

The article primarily presents the visit through climate education, community partnerships, and sustainability learning. Its connection to SDG 12 is supporting rather than direct: sharing sustainability-oriented learning and agricultural technology can help education leaders consider how environmental responsibility and more efficient resource practices may be incorporated into teaching and community activities. It illustrates CCCDO's role as a site for knowledge exchange, without claiming that the visit itself produced a specific waste-management or responsible-consumption outcome.

Figures and comparative analysis

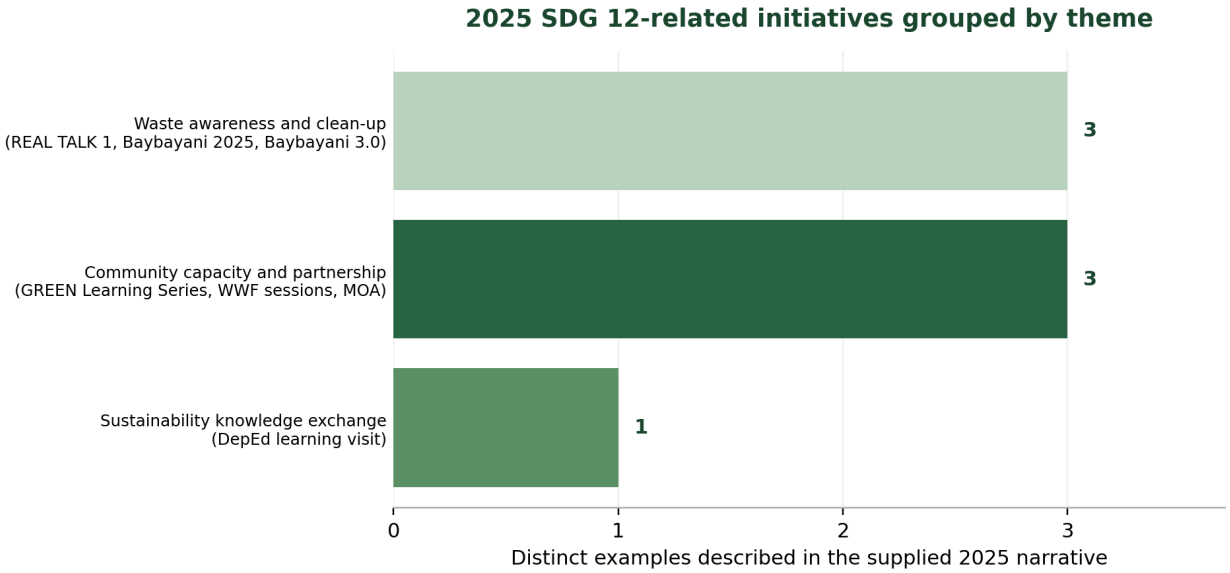

Figure 2. Distinct 2025 SDG 12-related examples grouped by theme from the supplied activity narrative.

Interpretation: Figure 2 groups the seven named examples described in the 2025 narrative into three themes. Three examples concern waste awareness and clean-up (Baybayani 2025, Baybayani 3.0, and REAL TALK 1); three concern partnership and community capacity (the WWF-Philippines agreement, the GREEN Learning Series, and related leader sessions in Caloocan and Quezon City); and one concerns sustainability knowledge exchange through the DepEd learning visit. The chart illustrates the structure of the supplied account, not a verified count of all institutional activities or a measure of environmental impact.

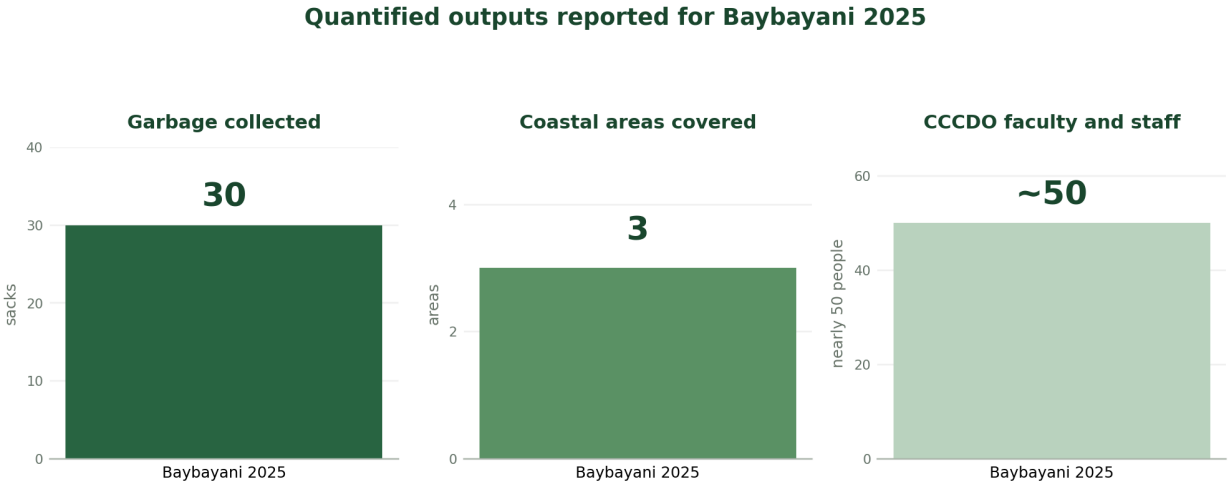

Figure 3. Quantified outputs reported for Baybayani 2025, held on February 28, 2025.

Interpretation: The source reports 30 sacks of garbage collected, three coastal areas visited, and nearly 50 CCCDO faculty and staff participating alongside local residents. These are distinct measures: sacks describe collected waste volume in the reporting unit, areas describe

geographic coverage, and the staff figure describes one segment of participation. They demonstrate that the activity produced tangible immediate outputs and involved institutional personnel in community action. The metrics should not be combined into a single total or interpreted as a change in waste generation, and the “nearly 50” figure does not represent the total number of all volunteers and residents.

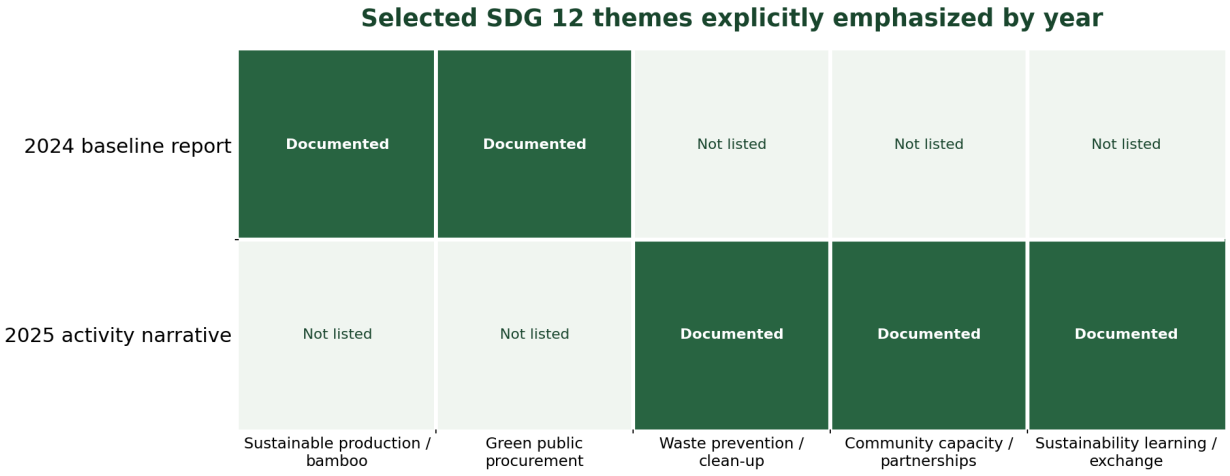

Figure 4. Comparison of selected themes explicitly emphasized in the supplied 2024 and 2025 reports.

Interpretation: The 2024 document emphasizes sustainable resource production through the Bamboo Hub and responsible institutional procurement through GPP. The 2025 narrative emphasizes waste awareness, clean-up, community leadership, environmental partnerships, and sustainability learning. The pattern shows a change in the visible emphasis of the reports: from planning around resources and procurement in 2024 toward more direct waste-focused and community-based activity in 2025. “Not listed” means a theme is not expressly described in that source; it does not prove the College had no related activity in that year.

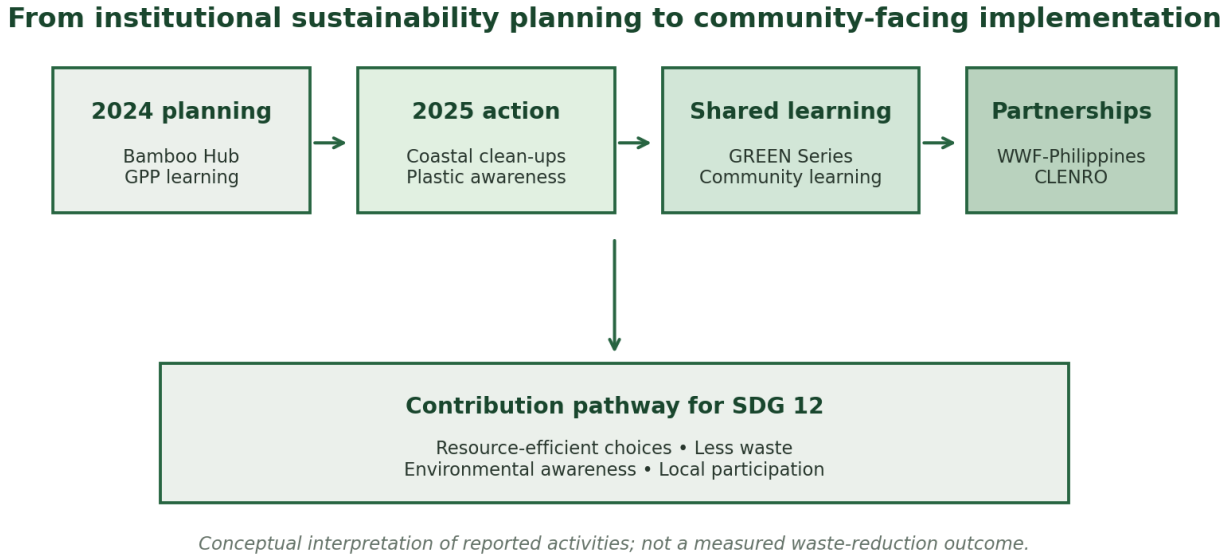

Figure 5. Conceptual pathway showing how the documented activities relate to intended SDG 12 contributions.

Interpretation: Figure 5 links the two years without presenting them as unrelated sets of events. The 2024 bamboo and procurement activities established resource-use and purchasing perspectives. The 2025 clean-ups demonstrated practical waste removal, plastic-reduction awareness addressed consumer behavior, and the WWF-Philippines / CLENRO learning activities emphasized local capacity and shared environmental responsibility. Together, these activities illustrate complementary pathways toward responsible consumption and production. The figure is a conceptual explanation of relevance, not a measured causal estimate of environmental change.

Comparative evidence table

Dimension	2024 baseline	2025 progress described	Why the change matters
Sustainable production and resource use	Exploratory meeting for a Bamboo Hub in Mambuaya; CCCDO committed to supporting TESDA-accredited Bamboo Engineering NC II and Bamboo Processing NC II qualifications.	The 2025 account places less emphasis on bamboo production and more on waste prevention, clean-up, and sustainability learning.	The 2024 production strand connects technical education to local renewable resources; the 2025 activities complement it by addressing waste generated after consumption.
Responsible institutional consumption	Finance Division attended the 4th National Summit on Government Procurement, with Green Public Procurement as a central theme.	The supplied 2025 narrative emphasizes environmental practices and community waste management more than internal procurement.	Procurement affects the materials and products an institution uses, while waste-management actions address how materials are handled after use. Both are relevant to a complete consumption-and-production approach.
Waste prevention and clean-up	Not a central focus of the supplied 2024 SDG 12 report, which concentrates on bamboo and GPP.	Baybayani 2025 reported 30 sacks of garbage from three coastal areas; Baybayani 3.0 and REAL TALK 1 also documented clean-up activities.	The 2025 record makes the downstream waste dimension more visible and provides a specific immediate output for Baybayani 2025.

Dimension	2024 baseline	2025 progress described	Why the change matters
Education and behavior	Technical qualifications were proposed in the context of bamboo resource development; procurement staff received GPP learning.	NSTP students participated in clean-up and plastic-reduction awareness, while community leaders and waste workers joined sustainability learning.	Education is a connecting mechanism across both years: workforce skills can support sustainable production, and public/community learning can influence waste-related decisions and practices.
Partnership and community capacity	The Bamboo Hub meeting involved resource-sector and public stakeholders; the procurement summit supported institutional learning.	The narrative documents collaboration with WWF-Philippines, CLENRO, local government and barangay actors, environmental groups, and education stakeholders.	Partnerships connect technical knowledge, local needs, and the people who implement environmental practices, widening sustainability engagement beyond campus.
Evidence of outputs	The 2024 report documents key events, a training commitment, and GPP learning, but does not quantify resulting resource savings or production volume.	The 2025 record gives specific Baybayani 2025 figures and describes additional events, while several other activities are reported qualitatively.	The output figures make one 2025 activity more tangible; the two years' records do not support a single numerical measure of overall SDG 12 progress.

Institutional contribution and synergy

The 2024–2025 record shows complementary ways in which a college can contribute to SDG 12. The 2024 Bamboo Hub initiative positioned technical education as a potential enabler of sustainable production, while GPP learning drew attention to the environmental implications of institutional purchasing. In 2025, clean-up and plastic-awareness activities connected sustainability to everyday consumption and waste handling. The WWF-Philippines collaboration and GREEN Learning Series linked the College to the leadership, knowledge, and coordination that community waste-management work requires.

The overall progression can therefore be understood across three dimensions. First, the focus widened from resource and procurement planning toward visible community action. Second, sustainability education became more applied through NSTP participation, practical clean-ups,

and plastic-reduction discussion. Third, the partnership dimension became more prominent in the supplied 2025 narrative, including training and learning beyond the College itself. These dimensions reinforce one another: resource and procurement choices shape consumption, daily habits shape the waste stream, and community capacity influences whether environmental practices can be organized and sustained.

This is why SDG 12 matters to higher education. Colleges use public resources and purchase goods and services, they prepare students for professional and community life, and they can share technical knowledge with local partners. CCCDO's reported activities show these roles through institutional procurement learning, proposed bamboo skills development, student environmental engagement, coastal clean-ups, and community-based sustainability education.

Alignment with SDG 12 themes

SDG 12 theme	Relevant CCCDO activities	Contribution explained
Sustainable use of natural resources	Bamboo Hub exploratory meeting and proposed bamboo technical qualifications in 2024.	Connects technical education with a renewable regional resource and the skills potentially needed for resource-efficient production and local value creation.
Sustainable public procurement	Finance Division participation in the 4th National Summit on Government Procurement and learning about GPP in 2024.	Places environmental considerations within public purchasing and supply-chain decisions, alongside planning and efficiency.
Waste prevention and reduction	Baybayani 2025, Baybayani 3.0, and REAL TALK 1 clean-up and plastic-awareness activities in 2025.	Removes existing waste from public spaces and draws attention to choices and practices that influence waste generation and disposal.
Awareness and sustainable lifestyles	"Ooopss, Bawal Plastik!" session, NSTP participation, and GREEN Learning Series.	Combines environmental information with practical participation and leadership learning, supporting the development of more responsible habits and local initiatives.
Partnerships for sustainable practice	CCCDO–WWF-Philippines collaboration, work with CLENRO, barangay leaders, waste-management stakeholders, and DepEd learning visit.	Shares knowledge across institutions and communities and connects sustainability education to local environmental responsibilities.

Conclusion

The comparative record shows that CCCDO's documented contribution to SDG 12 broadened between 2024 and 2025. The 2024 report emphasized strategic groundwork for sustainable

production through the proposed Bamboo Hub in Mambuaya and institutional learning on Green Public Procurement. These initiatives linked technical education and public purchasing to more responsible use of resources.

In 2025, the visible emphasis shifted toward practical waste prevention, coastal clean-up, plastic-reduction awareness, environmental leadership, and partnerships. Baybayani 2025 provides a specific quantified example: 30 sacks of garbage collected across three coastal areas, with nearly 50 CCCDO faculty and staff participating alongside local residents. Baybayani 3.0, REAL TALK 1, the GREEN Learning Series, the WWF-Philippines collaboration, and the DepEd learning visit extended the College's sustainability engagement across students, community leaders, waste-management stakeholders, and education partners.

The strongest conclusion supported by the documents is that CCCDO's SDG 12 approach developed from a 2024 emphasis on sustainable resource and procurement foundations toward a 2025 portfolio with more direct waste-related action and community sustainability learning. This matters because responsible consumption and production depend on both upstream decisions about resources and purchasing and downstream practices concerning waste, plastic, and environmental stewardship. The reported activities demonstrate institutional engagement and selected outputs without overstating them as measured reductions in overall waste or consumption.
