SDG 13 CLIMATE ACTION PROGRESS REPORT

Sustainable Development Goal 13 (SDG 13), *Climate Action*, calls for urgent action to combat climate change and its impacts. It emphasizes strengthening resilience to climate-related hazards, improving climate education and awareness, building institutional and community capacity, and integrating climate action into planning and practice. For higher education institutions, contributing to this goal involves environmental initiatives, climate-related research, education, disaster preparedness, and partnerships that help individuals and communities understand climate risks and develop effective responses.

The City College of Cagayan de Oro (CCCDO) contributed to SDG 13 through activities conducted in 2024 and 2025. In 2024, the College conducted and participated in four key initiatives: mangrove planting, an earthquake preparedness drill, participation in the Global Sustainable Development Congress, and a research presentation on community-driven disaster resilience at the 11th International Conference on Teacher Education (ICTED 2024). These activities connected environmental protection, emergency preparedness, research, and international sustainability engagement, establishing a foundation for the College's climate action efforts.

In 2025, CCCDO continued its environmental and preparedness initiatives while broadening its efforts through coastal clean-up activities, climate-resilience courseware development, teacher education, collaborative climate research, community leadership development, international sustainability engagement, and emergency preparedness. These activities demonstrated how climate action can be integrated into academic instruction, research collaboration, community participation, and institutional practices.

This report examines how CCCDO's climate action initiatives developed between 2024 and 2025 and explains their significance for environmental protection, climate education, disaster preparedness, and community resilience. It distinguishes actual activities and immediate outputs, such as the number of mangrove seedlings planted and sacks of waste collected, from longer-term outcomes, including improved climate literacy, reduced greenhouse gas emissions, and stronger community resilience. The available evidence demonstrates the College's implementation of climate-related activities and its contributions to environmental awareness, education, research, and preparedness. However, the overall climate impact cannot be quantified using the available activity records alone.

Executive Assessment

In 2024, CCCDO established a foundation for its SDG 13 initiatives through four activities, each assigned a 25% share in the original report's contribution distribution. These activities covered coastal ecosystem restoration through mangrove planting, disaster preparedness through an earthquake drill, global sustainability engagement through participation in the Global Sustainable Development Congress, and community-resilience research presented at

ICTED 2024. Together, these initiatives demonstrate the College's efforts to address climate-related concerns through environmental action, preparedness, research, and international engagement. The equal percentages reflect the original report's classification of activities rather than measured environmental impact.

The mangrove planting activity contributed to coastal environmental protection, while the earthquake preparedness drill provided an opportunity to practice emergency procedures and strengthen awareness of appropriate responses to hazards. Although earthquakes are geological hazards rather than climate-related events, preparedness drills contribute to broader institutional disaster readiness. Meanwhile, participation in the Global Sustainable Development Congress exposed the College to wider discussions on sustainable development, and the ICTED 2024 research presentation connected academic inquiry with community vulnerabilities and disaster resilience. These initiatives illustrate the importance of combining practical activities with research and knowledge-sharing to address environmental and community challenges.

In 2025, CCCDO broadened its climate action initiatives through continued environmental activities and more extensive engagement in climate education and research. The College conducted Baybayani 2025, which collected 30 sacks of garbage across three coastal areas, and Baybayani 2.0, which mobilized 60 volunteers to plant 300 mangrove seedlings. These activities promoted environmental responsibility, reduced litter in coastal areas, and supported mangrove rehabilitation. Proper waste management helps prevent discarded materials from entering waterways and marine environments, while mangroves provide habitats for wildlife, store carbon, and help protect shorelines from erosion and storm impacts when planted in suitable locations and maintained successfully.

Climate education and research also became more prominent in CCCDO's 2025 initiatives. The College participated in teacher-education research, developed locally relevant interactive courseware, engaged in two climate-education research projects supported by Japanese universities, presented research at conferences, and participated in a learning visit involving officials from 12 Department of Education (DepEd) regions. These activities strengthened the connection between climate knowledge, educational practice, research collaboration, and professional development. By developing locally relevant learning resources and engaging educators in climate-related discussions, CCCDO contributed to opportunities for climate concepts and resilience strategies to reach students, teachers, and other educational stakeholders.

Community leadership development and partnerships further complemented these efforts. Climate action requires cooperation among educational institutions, local government units, community leaders, and other organizations because climate-related risks affect communities differently depending on their location, resources, and preparedness. Through collaborative activities and knowledge-sharing, CCCDO supported opportunities for stakeholders to understand environmental concerns, exchange information, and promote collective responsibility. Its participation in international sustainability engagements also connected local initiatives with broader discussions on climate action and sustainable development.

The comparison shows that CCCDO expanded its approach from four major initiatives in 2024 to a broader combination of environmental participation, climate teaching and learning,

research dissemination, community capacity-building, institutional partnerships, international engagement, and safety preparedness in 2025. This progression reflects the College's continuing efforts to integrate climate action into environmental activities, academic work, and community engagement. It also highlights the complementary roles of practical conservation, education, research, and disaster preparedness in building a more climate-aware and resilient institution.

These initiatives matter because addressing climate change requires more than isolated environmental activities. It also requires accessible climate education, locally relevant research, informed decision-making, and the capacity of educators and community leaders to communicate risks and encourage appropriate responses. Through its conducted environmental activities, development of educational resources, research collaboration, and engagement with institutional and community partners, CCCDO contributed to climate awareness and the development of knowledge and capacities needed to address climate-related challenges.

Nevertheless, the documented activities and immediate outputs do not independently establish a college-wide reduction in greenhouse gas emissions or quantify long-term improvements in community climate resilience. The number of seedlings planted, for example, does not automatically indicate the number that survived or the amount of carbon ultimately stored. Similarly, the collection of waste demonstrates direct environmental action but does not, by itself, establish a lasting reduction in coastal pollution. Continued monitoring and evaluation of measurable indicators, such as mangrove seedling survival, restored coastal areas, waste collection and disposal, climate-literacy outcomes, and community preparedness, would provide stronger evidence of the lasting contributions of CCCDO's SDG 13 initiatives.

Overall, CCCDO's progress in 2024 and 2025 demonstrates an expanding commitment to climate action through environmental stewardship, academic development, research, and community engagement. Sustaining these initiatives, strengthening partnerships, and measuring their outcomes will help the College build on its accomplishments and demonstrate more clearly how its activities contribute to climate resilience, environmental sustainability, and the broader objectives of SDG 13.

Key Findings

- The 2024 source report identified four SDG 13 initiatives and allocated 25% of its contribution share to each, spanning ecosystem restoration, preparedness, international engagement, and disaster-resilience research.
- In 2025, practical environmental action continued through the Baybayani series, including 30 sacks of garbage collected from three coastal areas and 300 mangrove seedlings planted by 60 volunteers.
- Climate education and digital learning became more explicit in the 2025 narrative through teacher-education research, locally developed interactive courseware, conference dissemination, and a DepEd learning visit involving officials from 12 regions.
- International and institutional collaboration broadened through work with WWF-Philippines, CLENRO, Cebu Technological University, Japanese universities, and other education partners.

- Earthquake preparedness was present in both years. These drills support general institutional and disaster resilience, although earthquakes are geophysical hazards rather than climate-related hazards.
- The record supports a qualitative finding of broader and more integrated documented activity in 2025, not a quantified claim that climate impacts or greenhouse-gas emissions declined by a particular amount.

Institutional Context and SDG 13 Alignment

Climate action in higher education can be understood through connected pathways. Environmental activities help protect natural systems and raise awareness. Research and courseware help develop climate knowledge and provide educators with practical teaching resources. Community-leadership programs can support the people who organize local environmental initiatives. Partnerships bring together technical expertise, institutional capacity, and networks for sharing practices. Emergency drills contribute to safety and preparedness, a supporting element of institutional resilience.

The comparison focuses mainly on SDG 13.1, concerning resilience and adaptive capacity to climate-related hazards, and SDG 13.3, concerning climate education, awareness-raising, and human and institutional capacity. Mangrove rehabilitation has a nature-based connection to coastal protection and carbon storage when seedlings survive and ecosystems are maintained. Coastal clean-up activities are more directly associated with waste and pollution control, but they support broader environmental stewardship. Earthquake drills are included as a related institutional-resilience activity, not as direct evidence of climate adaptation.

2024 Baseline: Environmental Action, Preparedness, Research, and Global Engagement

Mangrove planting and environmental stewardship

On October 23, 2024, CCCDO personnel, faculty, and non-teaching staff were scheduled to participate in a mangrove-planting activity at the Mangrove Reserve in Bonbon, Cagayan de Oro, alongside other offices of the city government. The activity was associated with the 124th Philippine Civil Service Anniversary and positioned coastal ecosystem protection as a form of public service. Mangroves can support shoreline stability, habitat, and carbon storage as part of healthy coastal ecosystems. The 2024 report, however, does not provide a seedling count or survival measure for this event, so its contribution is best described as documented participation in environmental stewardship. [1]

Disaster preparedness and institutional safety

CCCDO's participation in the National Simultaneous Earthquake Drill in 2024 reflected attention to emergency readiness. Drills familiarize campus communities with protective actions, evacuation procedures, and coordination under simulated emergency conditions. In the context of SDG 13, this activity is relevant to the wider institutional culture of preparedness and risk awareness. An earthquake itself is not a climate hazard, but preparedness training can help strengthen safety systems within an institution exposed to multiple types of emergencies. [2]

International engagement and sustainability dialogue

In June 2024, CCCDO President Dr. Jestoni P. Babia represented the College at the Global Sustainable Development Congress in Bangkok, Thailand. The event connected the institution

with international discussions involving higher education, sustainability, and the Sustainable Development Goals. This was an institutional positioning milestone: it helped place CCCDO within a wider network of educators, researchers, and organizations discussing sustainable development. Its contribution to climate action is indirect, through knowledge exchange, institutional learning, and engagement with international sustainability priorities rather than a direct reduction in climate-related impacts. [3]

Community-driven disaster-resilience research

From November 13 to 15, 2024, a CCCDO team presented the study “Semiotic and Ethnographic Pictorial Analyses on Mapping Community Vulnerabilities: Educational Pathways for Local Disaster Preparedness” at the 11th International Conference for Teacher Education (ICTED 2024). The work focused on Barangay Agusan and used participatory approaches, including photovoice and focus group discussions, to understand local vulnerabilities connected with flooding, waste management, and landslides. This research linked academic inquiry with community knowledge and disaster-preparedness education. It also illustrates how place-specific information can support more relevant learning and community planning. [4]

Interpretation of the 2024 baseline

The four initiatives in the 2024 source report represent complementary routes into climate action. Mangrove planting connected the College with environmental protection; the earthquake drill emphasized readiness; the Global Sustainable Development Congress supported global engagement; and the ICTED presentation disseminated research on community vulnerabilities and disaster preparedness. Together, they established a broad institutional frame in which climate action could be approached through environmental stewardship, safety, knowledge production, and external collaboration.

The distribution chart below reproduces the 2024 report’s own 25% allocation for each listed initiative. These shares describe how the original report distributed its selected contribution categories. They are not measurements of cost, participation, carbon reduction, or the relative effectiveness of the initiatives.

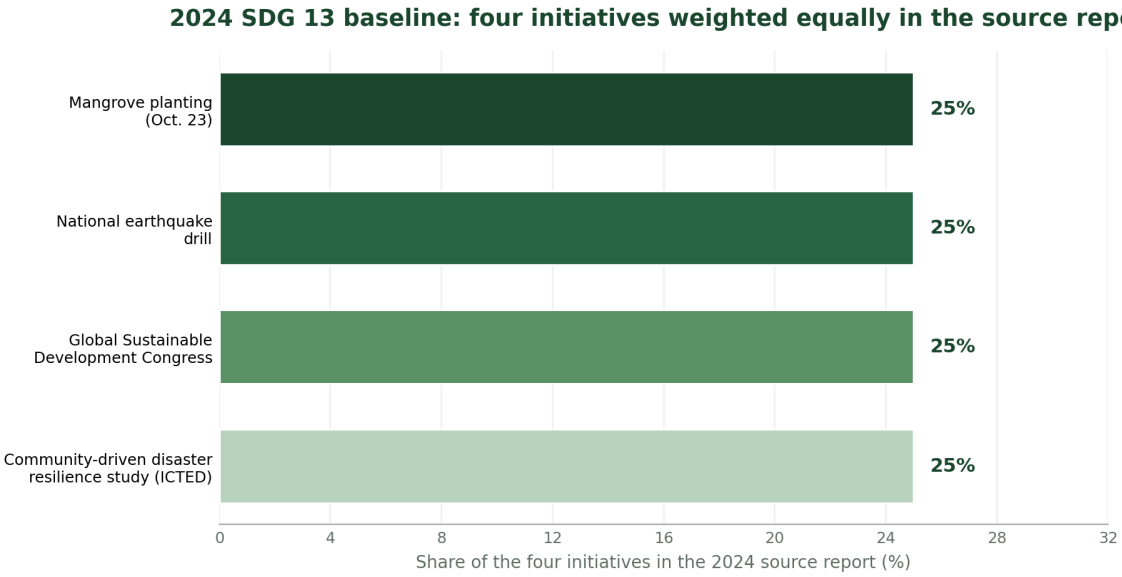

Figure 1. The 2024 source report assigned equal 25% shares to its four listed SDG 13 initiatives; this is the report’s own contribution distribution, not a measured impact score.

2025 Progress: From Environmental Activities to Climate Learning and Institutional Capacity

Environmental protection and coastal ecosystem rehabilitation

Baybayani 2025: Klarex nga Kalimpyo was conducted on February 28, 2025, across three coastal areas in Barangays Agusan and Consolacion. The report states that nearly 50 CCCDO faculty and staff participated alongside local residents and collected 30 sacks of garbage. The quantity collected is a concrete output that makes the environmental activity more specific than a general statement of participation. Removing waste from coastlines supports environmental stewardship and can help prevent litter from continuing into coastal waters. The output is not, by itself, a measure of greenhouse-gas reduction or a long-term climate outcome. [5]

Baybayani 2.0, held on March 15, 2025, in Barangay Pangayawan, Gitagum, Misamis Oriental, involved 60 volunteers and the planting of 300 mangrove seedlings in collaboration with CLIMBS Life and General Insurance Cooperative and Kusgan Volunteers Inc. The initiative is more directly connected to nature-based climate action because established mangroves can store carbon and provide coastal protection. Its longer-term significance depends on seedling survival and ecosystem conditions, but the documented planting count shows that the program moved beyond general awareness to a countable restoration activity. [6]

Baybayani 3.0 was conducted on Earth Day, April 22, 2025, at the Agusan coastal areas. CCCDO faculty, staff, and NSTP student volunteers participated with DENR Region X, CLENRO, Opol Community College, CLIMBS Cares, Plastik Republic, KUSGAN Volunteers Inc., and other partners. The article emphasizes coastal clean-up, environmental awareness, and cooperation rather than a new waste-collection total. Together, the Baybayani initiatives illustrate continuity: environmental action appeared repeatedly across the first part of 2025, with both waste-removal and ecosystem-restoration dimensions.

Climate education, teacher development, and digital courseware

A major development in the 2025 narrative is the visibility of climate education as an academic priority. At the ATECCE Phase 2 Workshop at Cebu Technological University, CCCDO President Dr. Jestoni P. Babia presented research on integrating climate change education into Teacher Education Programs in Northern Mindanao. The presentation addressed the challenge of translating environmental education policy into actual classroom practice and emphasized the role of faculty preparation, instructional resources, and practical support. This shifts the climate-action contribution from environmental participation alone toward the professional capacity of future teachers.

Through the Technology Innovation and Data Management Center (TIDMAC), CCCDO also presented a locally developed interactive climate education courseware application. The courseware was designed for access through websites and mobile devices and used locally contextualized learning materials. Such tools can make climate concepts more accessible and help educators connect abstract scientific topics with the conditions learners recognize in their own communities. The demonstration is a documented innovation output; it does not alone establish the number of courses that adopted the tool or the extent of change in learners' climate literacy.

The College's research team subsequently presented its climate and disaster resilience courseware and learning-video study at the Philippine Association for Teachers and Educators

(PAFTE) national and international convention in Baguio City. The research connected climate education, functional literacy, and disaster readiness, with particular attention to vulnerable communities. Dissemination through a national professional conference helped carry CCCDO's work into a wider teacher-education conversation. The October article provides a further record of that research presentation.

CCCDO hosted Department of Education officials representing 12 regions for a learning visit held on October 9, 2025. The visit included a session on climate-change microcredentials, a demonstration of the interactive courseware, a presentation of the Bayanihan Outreach Program, and a visit to the Fresco Greenovation Laboratory for sustainable agri-technology. This activity extended the College's sustainability learning beyond its own campus and created a channel for sharing institutional practices with education leaders from across the country.

Climate education research and international collaboration

The 2025 report identifies two climate education research projects that received co-funding and support from Okayama University and Miyagi University of Education in Japan. One project examined contextualized lesson plans intended to improve students' climate learning and engagement; the other explored game-based climate-resilience courseware for Grade 10 learners in Mindanao. The collaboration expands the institutional knowledge base and links locally relevant teaching approaches to international academic support. Its significance lies in building research and design capacity rather than asserting a quantified reduction in climate risk.

Institutional cooperation was also formalized through an MOU associated with the ATECCE Phase 2 Cebu Workshop. CCCDO spearheaded the signing with local and international higher education partners to support collaborative lesson planning for climate action, including content, pedagogy, and assessment. Earlier, on July 30, representatives visited Cebu Technological University to finalize the legal review of the MOU. These steps provided an organizational basis for knowledge exchange and collaborative work in climate education.

CCCDO's participation in the Global Sustainable Development Congress in Istanbul, Türkiye, from June 16 to 19, 2025, continued the College's engagement with the global higher education sustainability community. The institution also reported placement in the 1001–1500 band of the 2025 Times Higher Education Impact Rankings. This is relevant as an institutional sustainability milestone and as evidence of engagement with the SDGs, but it should not be interpreted as a direct measurement of CCCDO's emissions or climate impact.

Community leadership and environmental capacity-building

CCCDO's work with WWF-Philippines extended climate-adjacent environmental learning into community-leadership development. The GREEN Learning Series, organized with WWF-Philippines and CLENRO, brought together barangay leaders, community volunteers, and solid-waste-management stakeholders for sessions on leadership, community visioning, and financial literacy. The series included activities in Cagayan de Oro, Siargao, and Caloocan/Quezon City. Although these sessions were broader sustainability and leadership activities rather than climate-science instruction alone, they supported the local capacity required to organize and sustain environmental initiatives.

The ceremonial MOA signing between CCCDO and WWF-Philippines on June 18, 2025, supplied a more formal institutional basis for collaboration. This partnership links CCCDO's teaching and extension capacity with an environmental organization's experience in

conservation and community engagement. The combination of a formal agreement and subsequent learning activities indicates that partnerships were not only symbolic; they were associated with documented opportunities for environmental leadership training and shared knowledge.

Disaster preparedness and institutional resilience

CCCDO conducted a comprehensive earthquake drill on June 19, 2025, involving students, employees, and guests. Participants practiced “Drop, Cover, and Hold On,” evacuation using the buddy system, movement to designated areas, and headcounts. A third-quarter nationwide simultaneous earthquake drill took place on September 11, with participants again practicing emergency response and evacuation. These activities show continuity with the 2024 preparedness initiative and provide evidence that safety procedures remained part of the College’s institutional practice in 2025. Earthquake preparedness complements a wider culture of resilience, while remaining distinct from direct climate adaptation because earthquakes are not climate-driven hazards.

Figures and Comparative Analysis

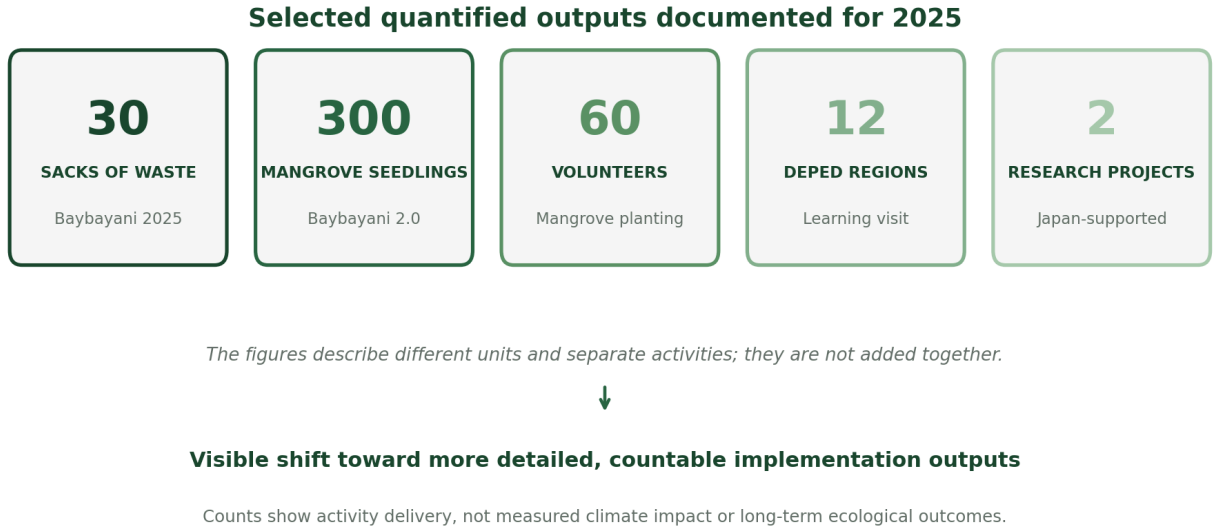

Figure 2. Selected quantified outputs documented in 2025. Each figure uses a different unit and refers to a specific activity; values are presented separately rather than combined.

Interpretation: The 2025 narrative supplies more activity-level quantities than the 2024 baseline. Baybayani 2025 recorded 30 sacks of garbage across three coastal areas; Baybayani 2.0 recorded 300 seedlings planted by 60 volunteers; the DepEd learning visit involved officials representing 12 regions; and two climate-education research projects received support from Japanese universities. These figures make specific implementation outputs visible. They should not be read as equivalent indicators or as proof of a quantified improvement in climate outcomes.

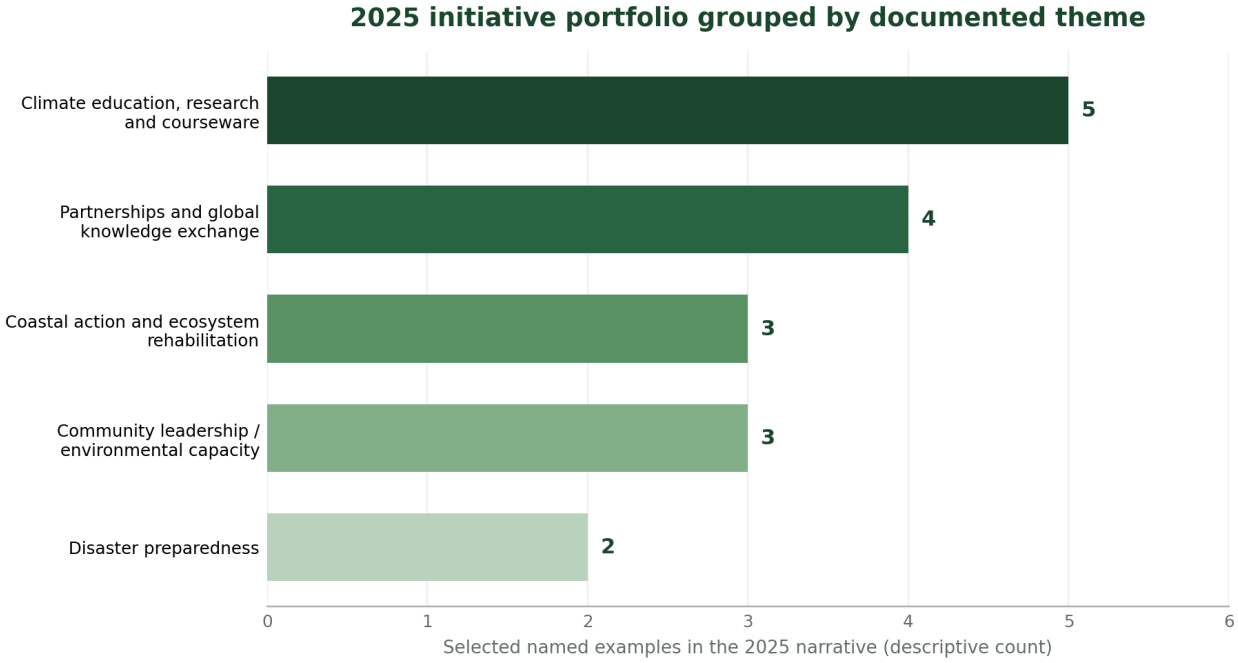

Figure 3. Selected named 2025 examples grouped by theme from the supplied narrative. Categories overlap and counts are an analytical inventory, not official institutional totals.

Interpretation: Climate education, research, and courseware form the most frequently described cluster in the 2025 narrative, followed by partnerships/global knowledge exchange, coastal action, community capacity-building, and disaster preparedness. This distribution reflects the emphasis of the written 2025 account. It does not show that one category had a larger real-world impact than another, and it is not directly comparable to the 2024 report's four equal percentage shares because the counting methods differ.

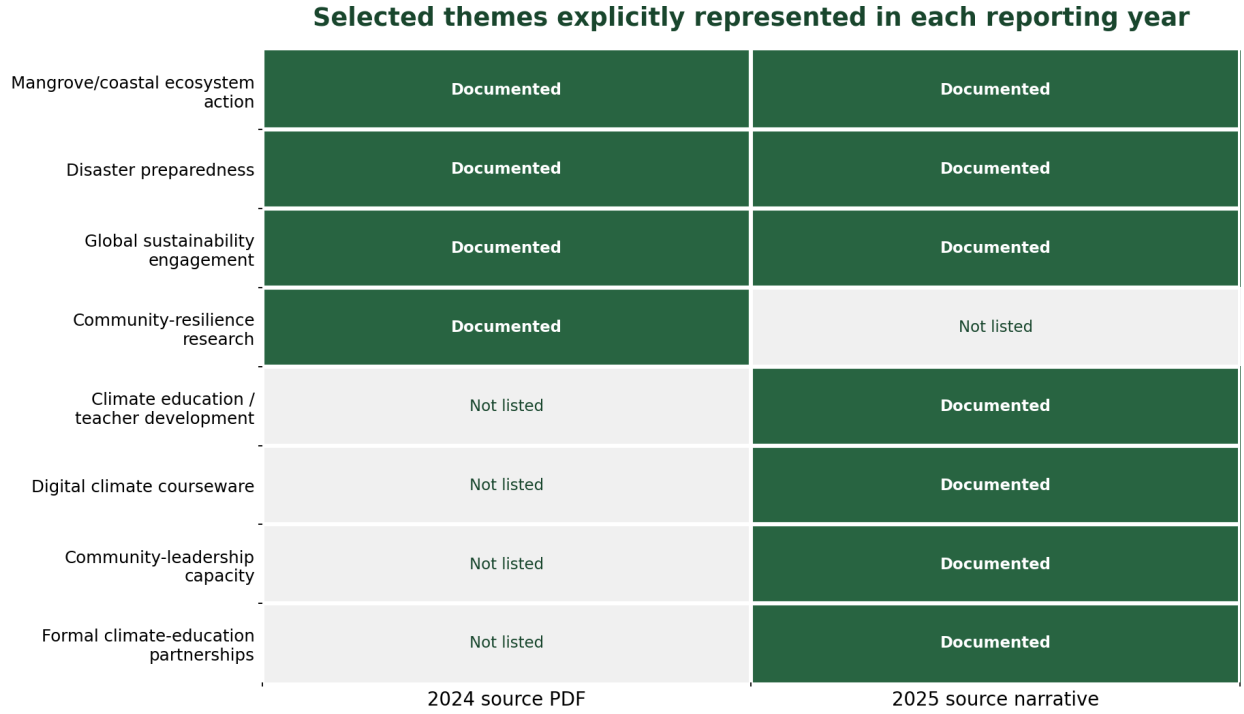

Figure 4. Presence of selected themes in the supplied 2024 and 2025 documents. "Not listed" means the theme was not explicitly described in that year's source; it does not prove no related activity occurred.

Interpretation: Mangrove/coastal action, preparedness, and global sustainability engagement appear in both years, showing continuity. The 2025 narrative gives much greater detail to climate education and teacher development, digital courseware, community leadership, and formal climate-education partnerships. The difference is best understood as a widening and more explicit articulation of the institutional portfolio, rather than a numerical claim that impact increased by a specific rate.

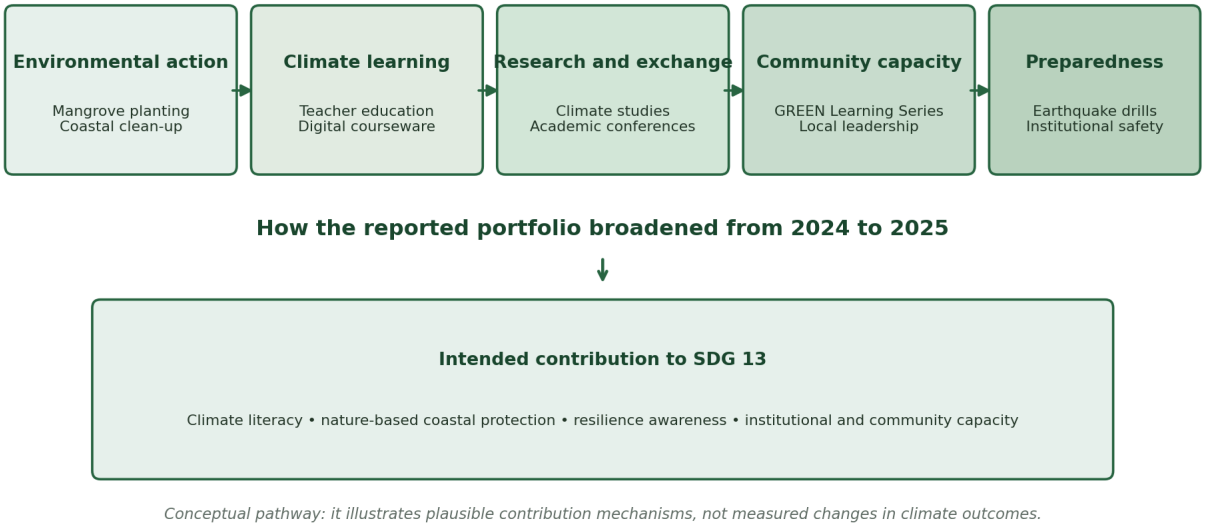

Figure 5. Conceptual pathway showing how environmental action, education, research, partnerships, and preparedness may support SDG 13. It illustrates plausible contributions, not measured changes in climate outcomes.

Interpretation: The pathway links practical environmental work with climate learning, research, partnerships, and preparedness. Together, these activities can strengthen climate literacy and institutional or community capacity. The diagram is conceptual and does not quantify emissions reduction or adaptation outcomes.

Comparative Analysis and Institutional Synergy

The comparison shows continuity in environmental action and preparedness, alongside a more explicit development of educational and research infrastructure in 2025. The 2024 source report framed climate action through four activities that received equal 25% contribution shares. The 2025 narrative documents a wider set of named actions and provides more information about practical outputs, educational resources, research partnerships, and the regional or international reach of activities.

Dimension	2024 baseline	2025 documented progress	Why the development matters
Environmental action	Mangrove planting activity on October 23, 2024.	Baybayani 2025 collected 30 sacks of waste across three coastal areas; Baybayani 2.0 planted 300 mangrove seedlings with 60 volunteers; Baybayani 3.0 continued coastal clean-up.	Provides practical participation and visible outputs in ecosystem and environmental stewardship, with mangrove restoration especially relevant to nature-based coastal resilience.

Dimension	2024 baseline	2025 documented progress	Why the development matters
Disaster preparedness	National Simultaneous Earthquake Drill.	Comprehensive earthquake drill in June and nationwide drill in September.	Shows continuity in emergency readiness and safety procedures; these drills support general resilience but are not climate-specific interventions.
Research and knowledge exchange	Presentation of community-driven disaster-resilience research at ICTED 2024; global sustainability congress participation.	Two climate education research projects supported by Japanese universities; climate courseware research presented at PAFTE and professional workshops.	Makes climate education and resilience more explicit as fields for applied research and teaching innovation.
Climate education	Research presentation highlighted community vulnerability and disaster-preparedness education.	Teacher education research, interactive courseware, microcredential discussion, and DepEd learning visit involving 12 regions.	Builds potential reach through educators and digital resources, extending climate learning beyond a single event or campus audience.
Institutional and community partnerships	Global congress engagement and community-linked research collaboration.	WWF-Philippines MOA, GREEN Learning Series, ATECCE MOU and CTU coordination, collaboration with Japanese universities.	Creates structures for shared expertise, community leadership development, and possible wider dissemination of climate learning practices.

How the portfolio progressed into 2025

The most important development is the transition from a small set of equally weighted headline activities in the 2024 report to a more interconnected set of initiatives in 2025. The 2024 baseline combined one environmental restoration activity, one preparedness activity, international sustainability engagement, and research dissemination. The 2025 account continued those strands while adding detailed evidence of courseware development, teacher preparation, collaborative research, formal educational partnerships, and community-leadership activities.

This broadening matters because climate action depends on sustained capability as well as event-based participation. Mangrove planting and clean-up activities allow students and staff

to participate directly in environmental stewardship. Research and courseware can help turn climate topics into usable classroom learning. Teacher-education workshops and the DepEd visit create opportunities for climate learning to spread through educator networks. Partnerships can support exchange of knowledge and local leadership, while emergency drills maintain an institutional focus on safety and readiness.

The strongest quantitative evidence in the supplied 2025 narrative describes immediate outputs—waste collected, seedlings planted, volunteers involved, regions represented, and research projects supported. The 2024 source, by contrast, assigns each of its four listed activities an equal 25% share and gives fewer comparable counts. Therefore, the comparison demonstrates broader documentation and stronger visibility of particular outputs in 2025, but it does not calculate a like-for-like percentage increase in climate performance.

Alignment with SDG 13

SDG 13 theme	CCCDO initiatives described	Contribution pathway
Target 13.1: Climate-related resilience and adaptive capacity	Community-driven disaster-resilience research at ICTED 2024; climate and disaster resilience courseware; community-leadership activities; earthquake preparedness drills as a supporting resilience measure.	Research can help identify local vulnerabilities; courseware can build learning capacity; community leadership can support collective preparedness. Earthquake drills support broader emergency readiness, not climate-specific adaptation by themselves.
Target 13.3: Climate education, awareness, and institutional capacity	Teacher-education research; interactive courseware; PAFTE dissemination; DepEd learning visit; Japanese university-supported research; ATECCE collaboration.	Education and digital learning resources may strengthen climate literacy and help future teachers integrate climate topics into teaching.
Nature-based climate action and environmental stewardship	Mangrove planting in 2024; Baybayani 2.0 and coastal clean-ups in 2025.	Mangroves can store carbon and protect shorelines when successfully established; clean-ups support environmental quality and stewardship, while not directly measuring emissions reductions.

SDG 13 theme	CCCDO initiatives described	Contribution pathway
Institutional and international cooperation	Global Sustainable Development Congress participation in 2024 and 2025; WWF-Philippines collaboration; MOU with educational partners; Japanese university support.	Partnerships create opportunities to exchange expertise, support research, develop teaching materials, and share practice across institutions and communities.

Why CCCDO's SDG 13 Progress Matters

Climate education matters because teachers and community leaders shape how environmental risks are understood and addressed. The 2025 courseware and teacher-education activities make climate concepts more accessible and locally relevant, extending climate engagement beyond one-time campaigns.

Healthy mangroves can store carbon, support biodiversity, and stabilize shorelines. Baybayani 2.0 documented 300 seedlings planted, a concrete output whose longer-term benefit depends on seedling survival and ecosystem condition; the count is therefore reported as planting activity, not measured climate impact.

Community-leadership training matters because environmental initiatives depend on local organizations and residents who coordinate decisions and resources. The GREEN Learning Series extended CCCDO's learning beyond campus and strengthened the capacity to organize sustained environmental action.

Partnerships matter because climate education and resilience benefit from shared expertise. Cooperation with WWF-Philippines, Cebu Technological University, Japanese universities, and DepEd supported knowledge exchange, research, courseware demonstrations, and dissemination of teaching practices.

Preparedness matters because institutions must protect students, staff, and visitors during emergencies. Earthquake drills in both years show continuity in campus readiness. Although earthquakes are not climate-related hazards, they strengthen general emergency coordination alongside climate-resilience education.

Conclusion

The 2024–2025 comparison shows CCCDO's documented contribution to SDG 13 broadening from four equally weighted initiatives in 2024—mangrove planting, earthquake preparedness, global sustainability engagement, and community-driven disaster-resilience research—to a more connected portfolio in 2025. Environmental participation continued through the Baybayani initiatives, while climate education became more prominent through teacher research, interactive courseware, conference dissemination, and collaboration with education partners.

Key 2025 outputs include 30 sacks of garbage collected across three coastal areas, 300 mangrove seedlings planted by 60 volunteers, a DepEd learning visit involving officials from 12 regions, and support for two climate-education research projects. Together, these activities demonstrate institutional engagement across environmental action, learning, research,

partnerships, and preparedness. They document implementation and participation rather than a quantified reduction in emissions or climate risk.
