SDG 6 CLEAN WATER AND SANITATION PROGRESS REPORT

Clean water and sanitation are fundamental to human health, environmental protection, and sustainable development. Access to safe water helps prevent waterborne diseases, supports personal hygiene, and improves the overall well-being of communities. At the same time, proper sanitation, effective wastewater management, and responsible waste disposal are necessary to prevent the contamination of rivers, coastal areas, groundwater, and other water sources. Recognizing these needs, the United Nations established Sustainable Development Goal 6 (SDG 6): Clean Water and Sanitation, which aims to ensure the availability and sustainable management of water and sanitation for all. This goal emphasizes the importance of improving water quality, increasing water-use efficiency, expanding access to sanitation, and protecting water-related ecosystems.

Achieving SDG 6 requires the participation of governments, educational institutions, private organizations, and local communities. Although public infrastructure and government policies play important roles in providing water and sanitation services, institutions can also contribute by adopting conservation measures, implementing environmental programs, promoting responsible waste management, and educating people about the importance of protecting water resources. Schools and colleges are particularly important in this effort because they serve as learning environments where students can develop sustainable habits and apply environmental knowledge through practical activities. Through institutional policies, community partnerships, and student participation, educational institutions can help strengthen environmental awareness and encourage collective responsibility for the protection of natural resources.

The City College of Cagayan de Oro (CCCDO) contributes to these efforts through documented environmental policies and activities that address resource conservation, waste management, and ecosystem protection. As a public educational institution serving students and the wider community, CCCDO has opportunities to integrate environmental sustainability into its campus operations, student activities, community engagement, and institutional partnerships. Initiatives such as water conservation, monitoring campus facilities for leaks, coastal clean-up drives, mangrove rehabilitation, tree-growing activities, and environmental education can support broader sustainability objectives. While these activities address different environmental concerns, they share a common purpose: encouraging responsible resource use and protecting the natural systems that contribute to clean and sustainable water resources.

In assessing CCCDO’s contributions to SDG 6, it is important to consider both institutional measures and community-based environmental initiatives. Institutional policies can help reduce unnecessary water consumption, promote efficient resource use, and establish responsible practices within the campus. Meanwhile, community clean-up drives and ecosystem restoration activities can help address environmental pollution and promote the protection of coastal and watershed areas. Mangroves, trees, and other natural ecosystems play important roles in maintaining ecological balance, supporting biodiversity, and helping

protect vulnerable areas. However, the implementation of these activities does not automatically demonstrate improvements in water quality or sanitation conditions. Their effectiveness must also be evaluated through appropriate monitoring, measurable indicators, and evidence of sustained environmental benefits.

This report examines and compares CCCDO's documented contributions to SDG 6 during 2024 and 2025. It reviews the institutional policies, environmental activities, partnerships, and reported outputs recorded during these two years to identify changes in the focus and scope of the college's initiatives. The 2024 record provides a baseline for examining the college's emphasis on water and electricity conservation, campus water-use practices, infrastructure and leak monitoring, and community clean-up activities conducted with local agencies. In comparison, the 2025 record documents a broader range of environmental initiatives, including coastal clean-ups, mangrove rehabilitation, tree-growing and watershed-related activities, environmental education, and formal collaboration with WWF-Philippines.

Through this comparison, the report seeks to explain how CCCDO's documented activities relate to the objectives of SDG 6 and how the institution's environmental efforts evolved between the two reporting years. It also examines the significance of the available quantitative outputs, including the reported collection of 30 sacks of garbage during Baybayani 2025 across three coastal areas and the planting of 300 mangrove seedlings by 60 volunteers during Baybayani 2.0. These figures provide evidence of completed activities and community participation, although they should not be interpreted as direct proof of long-term improvements in water quality, sanitation access, or ecosystem health.

Finally, this report recognizes that the quality and completeness of institutional documentation influence the extent to which environmental progress can be assessed. Differences in the level of detail provided in the 2024 and 2025 records limit the possibility of making a fully quantitative comparison of performance and impact. Accordingly, the analysis focuses on documented activities, institutional priorities, and reported outputs rather than claiming environmental improvements that have not been independently measured. By identifying both the contributions and the limitations of the available evidence, the report aims to provide a clearer understanding of CCCDO's role in advancing clean water and sanitation and to highlight opportunities for more consistent monitoring, reporting, and evaluation of future environmental initiatives

Key Findings

- In 2024, SDG 6 reporting emphasized institutional water conservation and community-facing pollution prevention, including a formal conservation policy and the REAL TALK 1 clean-up drive.
- In 2025, the documented activity portfolio expanded in visible detail to include repeated coastal clean-ups, mangrove planting, tree-growing, environmental education, and the WWF-Philippines partnership.
- The 2025 sources provide selected output counts—30 sacks of garbage, 300 mangrove seedlings, and 60 planting volunteers—while comparable 2024 output counts are not included in the supplied SDG 6 baseline.

- The reported approach moved from a combination of campus operations and one named community clean-up strand in 2024 toward a more place-based and ecosystem-focused set of activities in 2025.
- The materials establish continuity and a broadening of documented environmental action, but do not provide matched measurements to prove that water quality, water-use efficiency, sanitation conditions, or ecosystem health improved from 2024 to 2025.

Institutional Context and SDG 6

SDG 6 seeks to ensure the availability and sustainable management of water and sanitation for all. Within a higher education institution, relevant contributions can include conservation of water resources, pollution prevention, wastewater and sanitation management, protection of wetlands and other water-related ecosystems, environmental learning, and partnerships that support local participation. CCCDO's supplied 2024 report frames its contribution in two connected areas: internal resource management and external resource protection.

The 2024 report describes a Policy and Guidelines on Water and Electricity Conservation intended to promote responsible use and reduce waste, with behavior-related practices and infrastructure/monitoring measures. Externally, it identifies the NSTP-led REAL TALK 1 Clean-Up Drive and collaboration with the City Local Environment and Natural Resources Office (CLENRO), Oro Rescue 911, and the Department of Health (DOH). The 2025 narrative emphasizes actions in coastal and community settings, including Baybayani initiatives, mangrove restoration, tree planting, waste-prevention education, and collaboration with WWF-Philippines.

The comparison considers how those activities relate to SDG 6 targets 6.3 (water quality and pollution reduction), 6.6 (protection and restoration of water-related ecosystems), 6.A (international cooperation and capacity-building), and 6.B (local community participation). Alignment indicates a plausible contribution pathway; it should not be taken as proof that a target-level outcome was achieved.

Baseline Year: 2024 — Conservation Policy and Community Protection

Internal water management and conservation

The 2024 SDG 6 report identifies adoption of a Policy and Guidelines on Water and Electricity Conservation as the institutional foundation for managing water use. The stated approach combines formal rules with daily behavior: students and employees are encouraged to use water responsibly, turn off faucets when not in use, and reuse or recycle water where feasible. The report also describes regular checks for leaks in pipes and hoses and identifies low-water-consumption toilets and rainwater collection systems among the measures associated with more efficient resource use.

This is primarily a systems-oriented contribution. The policy provides a framework for integrating conservation into campus operations rather than relying only on one-time awareness campaigns. Leak checking can reduce avoidable losses, low-water fixtures can reduce demand where installed, and rainwater capture can offer an alternative supply for non-potable uses. However, the source describes these as policy measures and planned or encouraged practices; it does not provide an installation inventory, a measured volume of water saved, or monthly consumption data.

External protection and REAL TALK 1

The 2024 baseline also describes REAL TALK 1 as an NSTP-led Clean-Up Drive supported by CLENRO, Oro Rescue 911, and DOH. Its combination of clean-up and interactive sessions linked environmental action with student learning and cross-agency participation. CLENRO contributed environmental-management expertise, Oro Rescue 911 brought disaster-readiness knowledge, and DOH added a public-health perspective. This partnership structure connects pollution prevention with community safety and civic education.

The 2024 report does not give a measured quantity of waste collected, number of cleanup participants, or before-and-after water-quality data for this activity. Its evidence is therefore strongest at the level of documented institutional action, policy intent, partnership, and community engagement.

Sanitation and infrastructure context

The 2024 SDG 6 source focuses chiefly on resource conservation and clean-up activity. It does not provide a detailed inventory of water supply, wastewater treatment, sewer connection status, sanitation facilities, or water-quality testing. Consequently, the 2024 record establishes a policy and participation baseline more clearly than it establishes quantified sanitation performance.

Progress in 2025 — Repeated Clean-Ups, Ecosystem Restoration, and Partnerships

Baybayani 2025: Klarex nga Kalimpyo

On February 28, 2025, CCCDO conducted Baybayani 2025 in Barangays Agusan and Consolacion. The official college article reports that volunteers visited three coastal areas and collected 30 sacks of garbage. It also records participation by nearly 50 faculty and staff members, alongside local residents. Compared with the 2024 baseline, this provides a more specific and measurable account of a clean-up activity: location, number of coastal areas covered, sacks of waste collected, and a reported participation figure for college personnel.

This activity most directly relates to pollution prevention under SDG 6.3 because removing waste from coastal sites can reduce visible litter and the potential for debris to enter coastal waters. The documented 30 sacks are an immediate output, not a measurement of the overall pollution load or of long-term water quality.

Baybayani 2.0: Mangrove rehabilitation

On March 15, 2025, CCCDO and partners organized a mangrove planting initiative at Barangay Pangayawan, Gitagum, Misamis Oriental. The official article reports 60 volunteers and 300 mangrove seedlings planted, with collaboration involving CLIMBS Life and General Insurance Cooperative and Kusgan Volunteers Inc.

This marks a meaningful change in the visible emphasis of the 2025 record: the activity was not limited to removing waste but also addressed ecological restoration. Mangroves support coastal habitat, sediment retention, shoreline stabilization, and the broader functions of coastal ecosystems. These functions are relevant to SDG 6.6, which concerns water-related ecosystems. The available article documents seedlings planted, but does not provide survival rates, area restored, or evidence of changes in sediment, water quality, or biodiversity.

Baybayani 3.0: Earth Day coastal clean-up

On April 22, 2025, CCCDO participated in Baybayani 3.0 at the Agusan coastal areas in celebration of Earth Day. The official report describes participation by CCCDO faculty, staff, and NSTP student volunteers alongside organizations including CLIMBS Cares, Plastik Republic, DENR Region X, Opol Community College, MASSPECC, CLENRO, Kusgan Volunteers Inc., BFP, Coop NATCCO, and the Agusan Barangay Council.

The initiative strengthened the recurring character of coastal clean-up work in the 2025 record. Rather than appearing as a single stand-alone activity, coastal pollution prevention became a sequence of named Baybayani efforts. The source does not state the amount or weight of waste removed, total number of volunteers, or an area-wide pollution measure for Baybayani 3.0.

CCCDO–WWF-Philippines collaboration

The supplied 2025 report identifies a ceremonial Memorandum of Agreement signing with WWF-Philippines on June 18, 2025. The partnership adds an institutional collaboration dimension to CCCDO's environmental work and is presented as a source of technical guidance, capacity-building opportunities, and conservation expertise.

In comparison with the 2024 collaboration model, which named local government and public-service partners for a clean-up and awareness activity, the WWF-Philippines agreement represents a more formalized conservation relationship in the 2025 narrative. The source material does not specify a water-quality project, a technical intervention already implemented under the MOA, funding committed, or a quantified output attributable to the agreement. Its contribution is therefore best described as a formal partnership framework, not as a completed water-quality outcome.

REAL TALK 1: Environmental awareness and campus clean-up

It includes a separate 2025 entry for REAL TALK 1, held on October 24, 2025, titled "Prep Like a Pro, Ooopss Bawal Plastik!, and No Thanks!" The entry is presented primarily as a climate-action and health-awareness activity, but it includes a campus-wide clean-up and a plastic-reduction message. It is therefore relevant to SDG 6 as a cross-cutting pollution-prevention and environmental-education activity, although it is not described as a water-quality intervention.

The college account names CWTS and LTS students and speakers from Oro Rescue 911, CLENRO, and DOH. The activity shows continuity with 2024 in the use of NSTP engagement and multi-agency participation. It also places plastic reduction and environmental responsibility within a broader sequence of student learning and practical action. No waste quantity or water-quality result is given for this event.

Baybayani 4.0 and NSTP tree planting

Baybayani 4.0 was conducted on December 6, 2025, in Barangay Macasandig, Cagayan de Oro, through CCCDO's Extension and Outreach Office and City College Volunteerism and Involvement Center, in partnership with Andam Higala Inc. The college article mentions support from Kusgan Volunteers Inc. and CLENRO-CDO and describes a tree-growing activity with an environmental orientation and clean-up component. The provided report frames the activity as part of volunteerism and environmental stewardship.

On December 19, 2025, the NSTP Department held a tree-planting activity at Macasandig Rio Boulevard in cooperation with CLENRO. These activities extend the 2025 theme of hands-on environmental participation from coastal settings to tree cover and land-based environmental care. The potential SDG 6 relationship is indirect: vegetation can help limit erosion and runoff and support watershed health. The supplied records do not state the number of trees planted in either event, area planted, species, survival rate, or any measured water-related outcome.

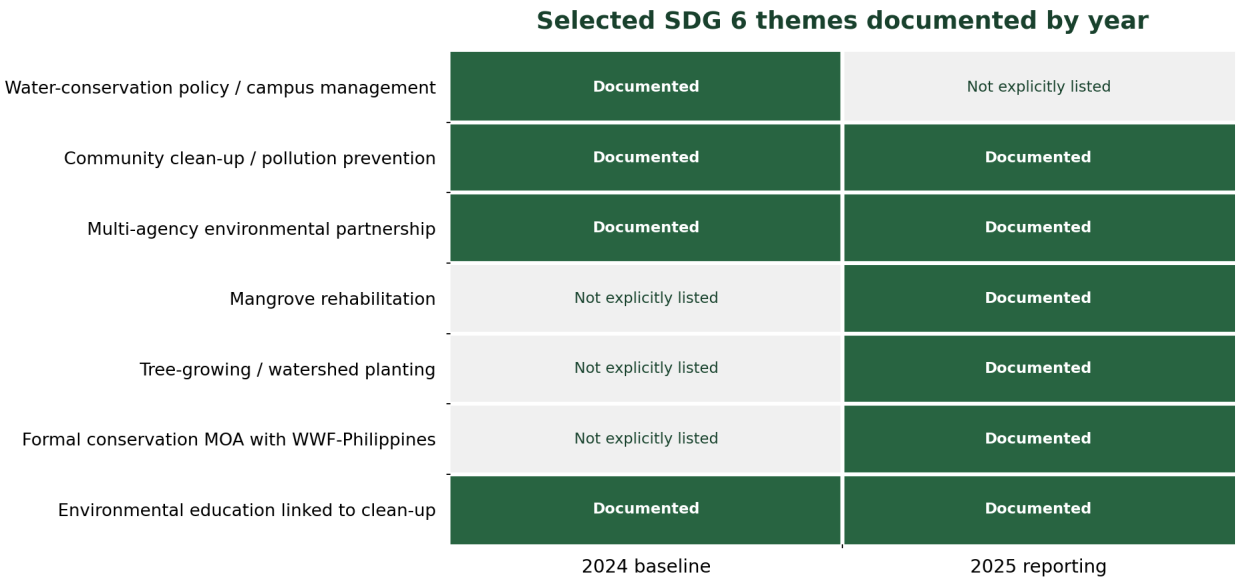

How the approach changed from 2024 to 2025

The most defensible description of change is a shift in the focus and visibility of the documented portfolio. In 2024, the main SDG 6 report emphasized internal water conservation and one community clean-up strand. In 2025, the records document several distinct activities across the year: at least three Baybayani phases, a mangrove planting activity, a formal WWF-Philippines collaboration, an NSTP environmental-awareness and clean-up event, and two tree-growing or tree-planting entries.

The progression has three connected dimensions. First, pollution prevention remained present through repeated clean-ups and a plastic-reduction message. Second, the 2025 record made ecosystem restoration more explicit through quantified mangrove planting and later tree-growing activities. Third, collaboration widened from local agencies involved in the 2024 clean-up to multi-organization coastal initiatives and a formal WWF-Philippines agreement. These are meaningful differences in the documented approach, but they do not in themselves prove a quantified increase in SDG 6 performance.

Why the change matters: clean water and sanitation are connected to everyday resource management, waste practices, healthy ecosystems, public education, and cooperation among institutions. A conservation policy can influence water demand and facility practices; clean-ups directly remove visible waste; ecosystem restoration supports the natural systems linked to water quality; and partnerships can connect local work with technical capacity. The strength of the overall contribution depends on whether these activities lead to lasting changes, which the supplied materials do not measure.

Figures and Comparative Analysis

"Not explicitly listed" describes the reviewed source, not confirmed absence of related work.

Figure 1. Selected themes documented in the reviewed materials. "Not explicitly listed" refers to the scope of the source reviewed and is not proof that no related activity occurred.

Interpretation: The 2024 source is clearest on formal water conservation and community clean-up. The 2025 materials explicitly add mangrove restoration, a formal conservation partnership, tree-growing and watershed-related activity, and environmental education. Both years include community environmental action. The figure compares documented themes, not activity scale or effectiveness.

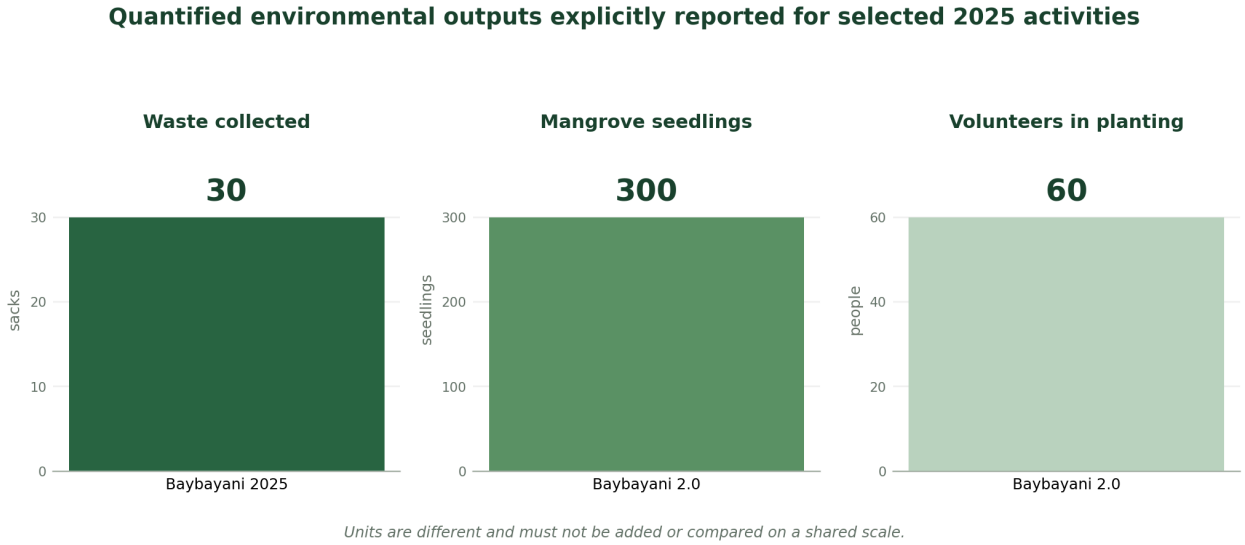

Figure 2. Verified quantities reported for two selected 2025 activities. Values use distinct units and are shown separately.

Interpretation: Baybayani 2025 reported 30 sacks of garbage collected across three coastal areas. Baybayani 2.0 reported 300 mangrove seedlings planted by 60 volunteers. These counts make selected 2025 outputs more measurable than the quantities reported in the supplied 2024 baseline. They cannot be compared with 2024 performance because the baseline report does not include equivalent waste, planting, or volunteer counts.

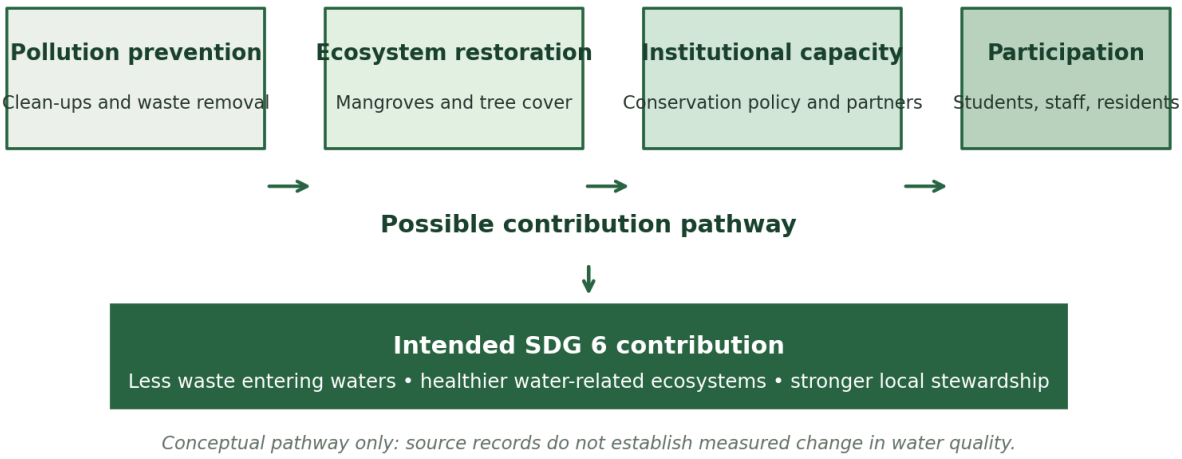

Figure 3. Conceptual results pathway linking CCCDO activities to intended SDG 6 contributions. It illustrates plausible mechanisms rather than measured outcomes.

Interpretation: Clean-ups may remove waste before it enters water systems; mangrove and tree planting may support ecosystem functions; conservation policy and partnerships may provide operational guidance and capacity; and community involvement may reinforce stewardship. Each pathway requires separate evidence before a broader water-quality or sanitation outcome can be attributed to it.

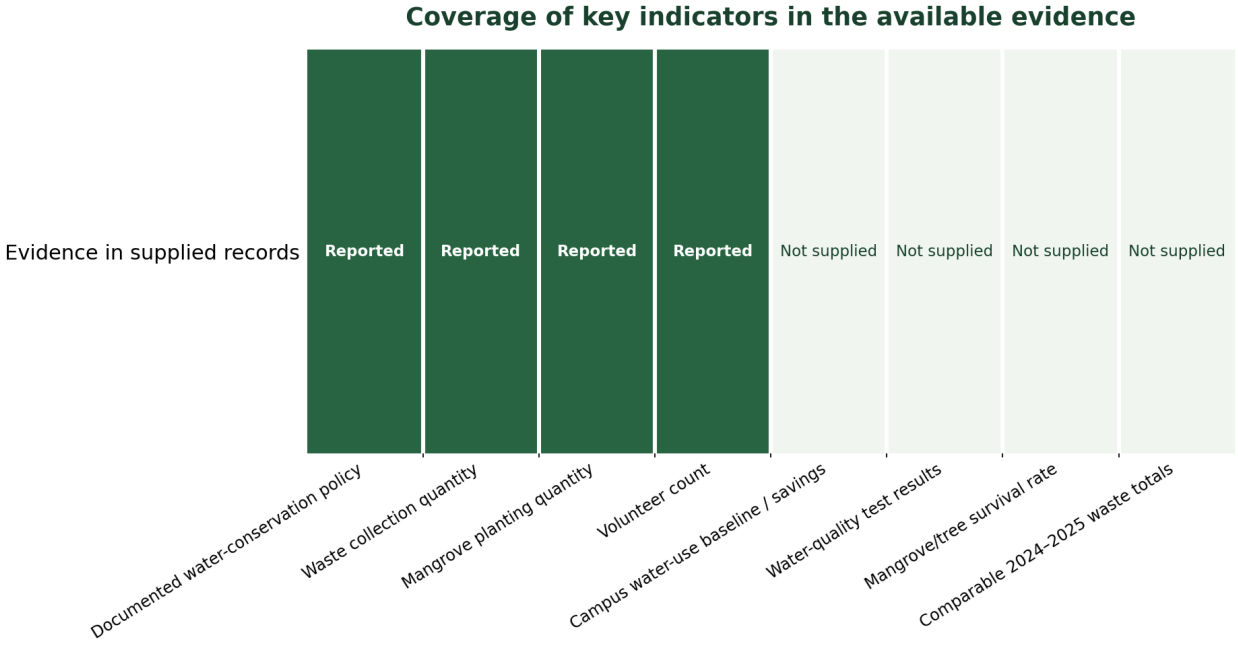

Figure 4. Evidence coverage across selected indicators in the supplied and verified source material.

Interpretation: The available records contain a conservation policy and selected 2025 output counts, but no comparable campus water-use baseline, water-quality test results, ecosystem survival rate, or matched annual waste totals. This imbalance in measurement limits the strength of direct 2024–2025 performance claims.

Comparative Evidence Table

Dimension	2024 baseline	2025 reporting	Comparative interpretation
Water conservation and campus operations	A formal water-and-electricity conservation policy; water-saving behavior; leak checks; low-water fixtures and rainwater collection identified as measures.	The provided 2025 narrative gives little comparable data on campus water use or conservation infrastructure.	The 2024 report is stronger on institutional policy. Continuation or measured effectiveness in 2025 cannot be established from the supplied information.
Pollution prevention and clean-ups	REAL TALK 1 clean-up drive and multi-agency environmental awareness	Baybayani 2025 reported 30 sacks of garbage across three coastal areas; Baybayani 3.0 and REAL TALK 1 also	The 2025 record has more detailed activity-level evidence and a specific quantity for one clean-up, but no

Dimension	2024 baseline	2025 reporting	Comparative interpretation
	described; no waste quantity supplied.	document clean-up work.	like-for-like 2024 comparison.
Water-related ecosystem restoration	Not a major focus of the supplied 2024 SDG 6 report text.	300 mangrove seedlings planted by 60 volunteers; Baybayani 4.0 and NSTP tree-growing / planting activities also listed.	Ecosystem restoration is more visible in the 2025 report. Plant survival and ecosystem outcomes are not measured.
Partnerships	CLENRO, Oro Rescue 911, and DOH listed for the 2024 clean-up and interactive sessions.	Multiple organizations participated in coastal work; MOA signing with WWF-Philippines is recorded.	The 2025 account broadens the visible partner network and formal collaboration structure; results attributable to the WWF agreement are not quantified.
Community and student participation	NSTP-led community action and awareness activities described, with no comparable participant totals.	Nearly 50 CCCDO faculty and staff plus local residents reported for Baybayani 2025; 60 volunteers reported for Baybayani 2.0.	The 2025 evidence provides selected participant counts; total unique participants across the year are unknown.
Water quality and sanitation outcomes	No quantified changes in water quality, water use, or sanitation outcomes given.	No comparable water-quality tests, water-saving figures, sanitation metrics, or long-term ecosystem outcome measures provided.	The documented work supports SDG 6-related mechanisms, but the materials do not demonstrate a measurable year-on-year change in outcome indicators.

Institutional Contribution and SDG 6 Alignment

The reported activities are relevant to several SDG 6 targets, although their degree of directness differs. The 2024 conservation policy is most directly connected to efficient water use and institutional resource management. Clean-up activities connect to pollution prevention under target 6.3. Mangrove rehabilitation and tree-growing are connected to the protection and restoration of water-related ecosystems under target 6.6, with the caveat that the tree-planting activities are described more broadly as environmental stewardship. The WWF-Philippines collaboration relates to cooperation and capacity building under target 6.A, while the involvement of students, residents, and partner organizations aligns with local participation under target 6.B.

SDG 6 target / theme	2024 evidence	2025 evidence	Evidence boundary
6.3 — Water quality and pollution	Conservation policy and REAL TALK 1 clean-up; waste reduction described but not quantified.	Baybayani 2025 waste collection (30 sacks); Baybayani 3.0 coastal clean-up; REAL TALK 1 plastic-reduction messaging and campus clean-up.	Activity outputs are documented, but no water-quality measurements or pollution load comparison is supplied.
6.6 — Water-related ecosystems	The primary supplied SDG 6 report emphasizes policy and clean-up more than ecosystem restoration.	300 mangrove seedlings planted; Baybayani 4.0 and NSTP tree planting/tree-growing activities documented.	Planting is a countable output; survival, area restored, habitat condition, and water-quality effects are unknown.
6.A — Cooperation and capacity	Local agency collaboration with CLENRO, Oro Rescue 911, and DOH.	WWF-Philippines MOA and multiple partner organizations in Baybayani activities.	Partnerships are documented; project-specific technical outputs, resources, and outcomes are not quantified.
6.B — Community participation	NSTP-led clean-up and interactive sessions.	Participation across Baybayani activities and tree planting; selected volunteer counts are reported.	There is no total unique participant figure for the year and no matched 2024 comparison.
Campus water and sanitation management	Formal water/electricity conservation policy with behavior and facility measures described.	Comparable 2025 water-use, wastewater, sanitation-facility, and conservation data are not included in the supplied narrative.	Continuity or measurable improvement in institutional water management cannot be concluded.

Conclusion

The 2024–2025 comparison shows a change in the documented emphasis of CCCDO's contribution to SDG 6. The 2024 baseline established an institutional conservation framework and connected water-related environmental protection with NSTP-led community clean-up and government-agency participation. In 2025, the recorded portfolio became more explicitly place-based and ecosystem-focused through successive Baybayani initiatives, mangrove planting, additional tree-growing and tree-planting activities, continuing clean-up efforts, and a formal WWF-Philippines partnership

The 2025 records provide more visible evidence of immediate outputs in selected activities, including 30 sacks of waste collected during Baybayani 2025 and 300 mangrove seedlings planted by 60 volunteers during Baybayani 2.0. These figures make aspects of implementation clearer, while the absence of matched 2024 quantities means that the magnitude of year-to-year growth cannot be calculated. Likewise, the reports document actions that are relevant to water quality, ecosystems, and public participation, but do not establish measured improvement in water-quality status, water-use efficiency, sanitation outcomes, or long-term restoration success.

The evidence therefore supports a conclusion of continuity and broadening in the documented approach—from institutional water conservation and clean-up activity in 2024 toward repeated pollution-prevention work, ecosystem restoration, community participation, and conservation partnership in 2025. The magnitude of environmental impact remains indeterminate in the absence of comparable outcome measurements.
